HOW TO USE THIS REGISTRY

1. The Registry of Toxic Effects of Chemical Substances (RTECS) is a compendium of toxicity data extracted from the scientific literature. All data listed in the Registry are referenced to the sources in which the data appeared. The Registry has not evaluated the data; inclusion herein does not mean endorsement of the reference. Evaluation of the cited references is the responsibliity of the reader.

2. An explanation of changes in the 1983 Registry appears in the Preface (page iv).

3. To find the main entry for a substance:

   a. Look up the substance name alphabetically, ignoring prefixes and numerals.

   b. If the name sought is the Registry prime name, it is preceded by a nine-position alphanumeric RTECS accession number. The complete RTECS data record follows the prime name.

   c. If the name sought is a Registry synonym, it is followed by a "see" cross-reference to the applicable prime name accession number. Look up the indicated number.

4. The data record for each substance includes, where applicable and available:

   substance prime name and synonyms
   date when data record was last changed
   CAS number, molecular weight, molecular formula
   irritation data and references
   mutation data and references*
   reproductive effects data and references*
   tumorigenic data and references*
   toxicity data and references
   IARC and ACGIH reviews
   OSHA, EPA, and DOT standards and regulations
   NTP carcinogenesis bioassay status
   NIOSH criteria document and current intelligence bulletin citations
   NIOSH analytical methods
   EPA TSCA status
   EPA Gene-Tox Program registry agents

*Inclusion of mutation, reproductive effects, or tumorigenic data does not automatically mean that the substance has these effects in humans. See the Introduction for a complete explanation.

An example of a typical RTECS data record appears in Figure 1. An explanation of each data field appears in the Detailed File Description.

5. A complete CAS Number—RTECS Accession Number Index, in numerical order by CAS number, begins on page 1 of Volume 1. Those numbers designating substances that appear in this edition (1983-84 Cumulative Supplement) are marked with an asterisk (*).

6. A complete list of all RTECS bibliographic references alphabetized by CODEN appears at the end of volume 2.

FOREWORD

This is the thirteenth edition of the "Registry of Toxic Effects of Chemical Substances," published by the National Institute for Occupational Safety and Health.

RTECS is intended to provide basic information on the known toxic and biological effects of chemical substances to employers, employees, physicians, industrial hygienists, toxicologists, researchers, and anyone else with the need to know in order to assure proper and safe handling of chemicals.

The complete file of RTECS was published in book form in the 1981-82 edition; this edition (1983-84) is a supplement to the complete file. All RTECS entries are in one of these two editions and, therefore, readers can disregard the earlier supplement dated 1983. Together, the two editions (1981-82 and 1983-84 Supplement) fulfill the mandate of the Occupational Safety and Health Act of 1970, to NIOSH to annually publish a list of known toxic substances.

We hope this information will contribute to a better understanding of potential occupational hazards and hence prevention of work-related diseases and injuries.

J. Donald Millar, M.D., D.T.P.H. (Lond.)
Assistant Surgeon General
Director, National Institute for
Occupational Safety and Health
Centers for Disease Control

BEST COPY AVAILABLE

This publication is a 2-volume, 1983-84 Supplement to the 1981-82 Edition of the NIOSH Registry of Toxic Effects of Chemical Substances (RTECS). This edition is the thirteenth edition prepared in compliance with the requirements of Section 20(a)(6) of the Occupational Safety and Health Act of 1970 (Public Law 91-596). The original list was completed on June 28, 1971, and until the 1981-82 Edition, had been updated annually in book format. The 1981-82 Edition added two years' accumulation of data and was expanded to three volumes. Because of the rapid growth of the RTECS file, the 1983 edition was prepared as a two-volume supplement to the 1981-82 Edition. This current edition is a cumulative supplement containing all data from the 1983 Supplement and that which was added during calendar year 1984. This edition, therefore, contains all new substances entered into the file and all substances for which changes in the data have been made between January 1983 and January 1985. It also includes all substances for which regulatory or concensus group information is cited (e.g., OSHA standards, DOT regulations, ACGIH-TLVs). Therefore, this supplement should be used together with the 1981-82 Edition if the complete file is needed.

All readers are strongly encouraged to review the Introduction and the Detailed File Description in this volume before using the Registry. This material contains a complete description of the types of data contained in the RTECS file, including an explanation of the applicability and limitations of the data. The reader should note that the Registry is a compendium of toxicity data extracted from the scientific literature. Because the Registry does not evaluate the data, inclusion herein does not mean endorsement of the cited literature. Evaluation of the references included in the Registry is the responsibility of the reader.

The 1983-84 Registry Supplememt is printed in the same format as the 1983 Supplement: all substance prime names and synonyms are listed in alphabetical order, and each synonym is cross-referenced to its appropriate prime name accession number. A complete Chemical Abstracts Service (CAS) Number - RTECS Accession Number Index in numerical order by CAS Number is included in Volume I. This index allows the reader to look up RTECS data for a substance when only its CAS Number is known. CAS Numbers of substances contained in this edition are marked with an asterisk (*).

This Supplement to the Registry contains 26,341 prime chemical substances with their associated toxicity data. For these entries, 113,211 synonyms are included as cross-references. All prime name listings are either new entries to the file or contain changes in the data from the 1981-82 Edition. All substances with associated regulatory data are included and comprise the only duplications of data from the 1981-82 Registry. Statistics about selected data fields in the published Registry (1981-92 Edition, 1983 Supplement, 1983-84 Supplement) follow:

Data Type	Number of Compounds			Number of Citations		
(Data Lines)	1981-82	1983	1983-84	1981-82	1983	1983-84
Tumorigenesis	3,260	2,860	2,943	6,259	6,735	7,196
Mutagenesis	5,152	3,587	4,202	14,618	14,566	17,207
Reproductive Effects	2,145	2,390	3,441	7,717	13,275	12,864
Primary Irritation	2,943	1,722	2,001	4,384	2,773	3,202
Human Toxic Effects	-----	-----	-----	1,533	1,785	2,081
Chemical Abstracts Service Registry Numbers	41,042	13,006	16,557			
Federal Standards	2,583	3,171	3,435			
Recommended Standards from NIOSH Criteria Documents*	1,131	1,109	952			

*As of the date of this file, NIOSH has published 109 Criteria Documents, but some documents cover classes of compounds, such as inorganic lead, many members of which are found in the Registry.

BEST COPY AVAILABLE

The 1981-82 Edition of the Registry is available only from the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, Virginia 22161, Telephone: (703) 487-4650.

The NIOSH Criteria Document section has been altered to conform with "NIOSH Recommendations for Occupational Health Standards", as published in the January 31, 1985 issue of the Centers for Disease Control Morbidity and Mortality Weekly Report. See Appendix I for the full text.

The 1984 RTECS computer tape is now available from NTIS. See Appendix IV for ordering information.

Through an agreement with the National Library of Medicine (NLM), Bethesda, Maryland, the complete Registry file is now available to all subscribers to NLM on-line services. This system permits real-time searching and assembly of RTECS subfiles tailored to the particular needs of the user. For additional information on this service, see Appendix V.

The RTECS file has also been integrated into the Chemical Information System (CIS), which is a linked collection of computerized data bases of chemical and toxicological information. The CIS is available commercially from Fein Marquart and Company. For additional information, see Appendix VII.

EDITORIAL REVIEW BOARD

The RTECS Editorial Review Board was established to serve as a source of advice and technical review for the RTECS data file. The Board consists of representatives from various NIOSH divisions and from other agencies that have a direct interest in the RTECS program. The Board meets periodically to resolve questions of policy and to review current and projected RTECS operations.

The Board members are:

Richard A. Lemen	Director, Division of Standards Development and Technology Transfer
Kathryn R. Mahaffey	Division of Standards Development and Technology Transfer
Richard J. Lewis, Sr.	Chairman Division of Standards Development and Technology Transfer
Doris V. Sweet	Executive Secretary Division of Standards Development and Technology Transfer
Peter M. Eller, Ph.D.	Analytical Chemistry Division of Physical Sciences and Engineering
David H. Groth, M.D.	Pathology Division of Standards Development and Technology Transfer
Daniel M. Lewis, Ph.D.	Immunmology Division of Respirable Disease Studies
Trent R. Lewis, Ph.D.	Toxicology Division of Biomedical and Behavioral Sciences
Robert W. Mason, Ph.D.	Biology Division of Biomedical and Behavioral Sciences
David P. Sundin	Hazard Surveillance Division of Surveillance, Hazard Evaluation, and Field Studies
Rodger L. Tatken	Information Retrieval Division of Standards Development and Technology Transfer
Thomas N. Tower	Technical Data Center Occupational Safety and Health Administration
Vera W. Hudson	Office of Hazardous Substances Information National Library of Medicine

ACKNOWLEDGMENTS

NIOSH wishes to thank Jenny Chin-fong Fang, Program Manager for AEPCO, Inc., and her staff--Fabio D'Angelo, Dianna T. Flake, Ann S. Gravatt, Nancy Hendler, Gloria Heuckeroth, Kathy Arnette Keith, Teresa Mei-yun Liu, Joel Nicolas, Rodrigue Moise, Jess P. Rimon, David T. Shiang, and Karen Lynne Young--for their excellent efforts in performing their contract responsibilities for the Registry.

During 1984, we were pleased to receive contributions, suggestions for improvement, and corrections in the content of entries in the Registry from the persons listed below. User participation is potentially far more valuable than staff effort in the collection and evaluation of data in this field. Therefore, in order to improve subsequent editions both in quality and comprehensiveness, participation by all users is strongly encouraged.

BACKGROUND

This edition of the Registry of Toxic Effects of Chemical Substances is the thirteenth edition prepared in compliance with the requirements of the Occupational Safety and Health Act of 1970 (Public Law 591-596). The original list was completed on June 28, 1971, and has been updated annually in book format until the 1981-82 Edition. This edition contained a two year accumulation of new data and was published in June 1983. That edition was expanded to three volumes. The 1983 edition was a supplement to the 1982-82 Edition and contained all new and altered data entered into the file during 1983. In addition, all substances in the file for which regulatory information was entered were included in the 1983 edition. This 1983-84 Edition is a cumulative supplement to the 1981-82 Edition and contains all new and altered data entered into the file during 1983 and 1984. It is an expansion of the 1983 Supplement to include 1984 data; it is still supplementary to the 1981-82 Edition.

In offering this edition of the Registry, the editors intend to identify "all known toxic substances" which may exist in the environment and to provide pertinent data on the toxic effects from known doses entering an organism by any route described. The data have been assembled in accordance with the definitions and criteria presented below.

In offering this edition, the editors recognize its limitations in achieving the goal that they have set for it. It does not include all chemicals for which toxic effects have been determined, and will not for some time. This cannot be achieved without the full cooperation of the scientific community. Cooperation in the form of personal communications will become increasingly imperative as the Registry becomes more nearly complete.

The Registry's purposes are many, and it serves a variety of users. It is a single source document for basic toxicity information and for other data, such as chemical identifiers and information necessary for the preparation of safety directives and hazard evaluations for chemical substances. The various types of toxic effects linked to literature citations provide researchers and occupational health scientists with an introduction to the toxicological literature, making their own review of the toxic hazards of a given substance easier. By presenting data on the lowest reported doses that produce effects by several routes of entry in various species, the Registry furnishes valuable information to those responsible for preparing safety data sheets for chemical substances in the workplace. Chemical and production engineers can use the Registry to identify the hazards which may be associated with chemical intermediates in the development of final products, and thus can more readily select substitutes or alternate processes which may be less hazardous. Some organizations, including health agencies and chemical companies, have included the NIOSH Registry Accession Numbers with the listing of chemicals in their files to reference toxicity information associated with those chemicals. By including foreign language chemical names, a start has been made toward providing rapid identification of substances produced in other countries.

It must be reemphasized that the entry of a substance in the Registry does not automatically mean that it must be avoided. A listing does mean, however, that the substance has the documented potential of being harmful if misused, and care must be exercised to prevent tragic consequences. Thus, the Registry lists many substances that are common in everyday life and are in nearly every household in the United States. One can name a variety of such dangerous substances: prescription and non-prescription drugs; food additives; pesticide concentrates, sprays, and dusts; fungicides; herbicides; paints; glazes; dyes; bleaches and other household cleaning agents; alkalies; and various solvents and diluents. The list is extensive because chemicals have become an integral part of our existence.

Drugs, or therapeutic chemicals, have been deliberately included in the Registry if they have been reported to produce a noxious effect. It is reasonable to expect to find such substances listed because they have been developed for their biologic effects. Some drugs achieve the desired effect when administered in a therapeutic quantity by supporting human physiologic activity; others may be beneficial to humans because they are toxic to human parasites. In any case, a quantity greater than the prescribed therapeutic dose may cause undesired toxic effects in humans. For some individuals, the normal therapeutic dose of a drug may produce toxic as well as therapeutic effects. Because drugs may be dangerous, our society has licensed certain practitioners, including physicians, dentists, and pharmacists, to handle the more potent substances intended for human therapeutic use. Similarly, other people are licensed, based on special training, for the handling of pesticides in a safe manner. It is wise to accept the direction of these experts in order to avoid undesirable consequences from misusing chemicals.

Other toxic substances in the environment have appeared there as a result of natural environmental reactions of waste products from our technology, as distinct from the waste products themselves, or from naturally occurring substances. The products of these reactions may be found in the air we breathe and the water we drink. Even though these substances may be present in the environment in concentrations that are non-hazardous by themselves, their toxic potential must not be ignored, especially when additional exposure in the occupational or home environment may occur.

In general, toxic substances that appear in the home and community have been collected, processed, synthesized, packaged, and distributed by someone within the workplace. Some substances may be unwelcome cohabitants of the work environment. The safety and health of individuals in the workplace are the principal concerns of the Occupational Safety and Health Act of 1970. The Act addresses the problem of worker exposure to all toxic substances present in the workplace--not only those in the finished commercial product or in the intermediates used in its production, but also those which occur as waste products resulting from industrial processing.

RTECS DATA SELECTION

The toxicity information appearing in the Registry is derived from reports of the toxic effects produced by individual substances. The absence of a substance from the Registry does not imply that the substance is non-toxic, and thus non-hazardous, any more than the presence of a substance in the Registry indicates that the substance is hazardous in common use. A substance may not appear for a variety of reasons, e.g., (1) the test results could not be

BEST COPY AVAILABLE

cited because the protocol of the study did not meet the RTECS selection criteria, (2) the substance has not yet been tested, or (3) the substance has been tested but the RTECS literature search has not yet uncovered the data.

The Registry includes substances which have been selected primarily for the toxic effect produced by single doses, some lethal and some non-lethal. However, the principal toxic effect of some substances results from exposure over a longer period of time, i.e., from the accumulation of a substance or its metabolites, or from the summation of continuing non-lethal, noxious insults which may eventually disable basic bodily functions. Although these substances are of concern, they may not be found in this edition due to our present selection criteria. However, when the toxic effect has been described by the author as tumorigenic, mutagenic, or reproductive, even though the effect was produced by repeated exposure, the toxic dose data are reported.

For human data, a toxic effect is defined as any reversible or irreversible effect on the body that has been reported to have resulted from exposure to a substance via any route. These effects include irritation, mutation, reproductive effects, tumorigenesis, effects on any organ or functional system, or death. For human data, therefore, a toxic effect is any effect that was reported in the source reference. There is no qualifying limitation on the duration of exposure or for the quantity or concentration of the substance, nor is there a qualifying limitation on the circumstances that resulted in the exposure. Regardless of the absurdity of the circumstances that were involved in a toxic exposure, it is assumed that the same circumstances could recur. For animal data, toxic effects are limited to irritation, mutation (measured both in vivo and in vitro), reproductive effects, tumorigenesis, or death. When reports of animal death also include information about toxic effects seen prior to death, hese effects are also noted. There is no limitation on either the duration of exposure or on the quantity or concentration of the dose of the substance reported to have caused these effects.

The report of the lowest total dose administered over the shortest time to produce the toxic effects was given preference, although some editorial license was taken so that additional references might be cited for the reader's consideration. No restrictions were placed on the amount of a substance producing death in an experimental animal nor on the time period over which the dose was given. By law, however, a toxic effect must be produced for the dose cited in the Registry. Therefore, reports suggesting that a toxic or lethal effect may exist at doses greater than those tried cannot be used.

RTECS DATA EVALUATION AND RISK ASSESSMENT

Toxicity data reported in the literature are transformed into Registry format using the criteria presented in this Introduction and the Detailed File Description. In most cases, no attempt is made to resolve any questions about published data. We rely on editing provided by the scientific community prior to publication in the scientific literature. One of the responsibilities of the RTECS Editorial Review Board, however, is to review a limited number of citations to resolve any ambiguities. Citations may be suggested for Board consideration by the data abstractors, the editors, or the Registry readership. The Board will review citations for resolution of ambiguities, but will not judge the relative merits of several publications which present contradictory data on the same substance. The Registry strives to accurately reflect the literature as it exists, leaving to others the problem of grappling with contradictory data.

It is not the purpose of the Registry to quantitate a hazard through the use of the toxic concentration or dose data that are presented with each substance. UNDER NO CIRCUMSTANCE CAN THE TOXIC DOSE VALUES PRESENTED WITH THESE CHEMICAL SUBSTANCES BE CONSIDERED DEFINITIVE VALUES FOR DESCRIBING SAFE VERSUS TOXIC DOSES FOR HUMAN EXPOSURE. Concentrations of chemical substances in the work environment which may be safely tolerated can be determined only by a critical evaluation of all available pertinent data by experienced investigators, data that include but are not limited to that listed in this Registry.

A critical evaluation of the hazard of a chemical in the workplace or environment involves much more than a determination of its toxic potency, no matter how complex that determination may be. A hazard evaluation must include such a determination, of course, but toxic potency and degree of hazard are not synonymous. Identifying and defining the hazard of a chemical must also include, among other factors, the evaluation of the amount and duration of exposure, the physical characteristics of the substance, the physical conditions under which exposure occurs, and the evaluation of interactions with other substances that may be present. All of these factors may significantly alter the toxic potency of a substance which, in turn, may alter the health of the person exposed.

MUTATION, REPRODUCTIVE EFFECTS, AND TUMORIGENIC DATA

Since October 1978, the Registry has included citations to positive in vitro mutation data. This mutation data line was developed in response to the recent rapid development of in vitro mutagenicity tests and their use in evaluating chemical toxicity. Perhaps the most well-known of these is the Ames test, developed by Dr. Bruce N. Ames and his co-workers at the University of California (Proc. Natl. Acad. Sci., 70:782-786, 1973). In vitro tests utilize primarily bacterial species and mammalian cell lines. They are comparatively simple and less expensive to perform than the multigeneration mammalian and insect (primarily drosophila) studies previously used in mutation research. However, in vitro studies still provide a method for measuring the effect of a substance on the genetic material of the tested species. According to the National Toxicology Program (NTP) Fiscal Year 1980 Annual Report (page 23), "Mutagenicity assays identify structural or functional DNA perturbations in germinal or somatic cells. Effects in germ cells are important for predicting potential undesirable effects on fertility, the developing conceptus, or in generations subsequent to that which received chemical exposure. Somatic mutation may be predictive for physiologic alterations in the exposed person and for the potential induction of cancer."

The relative ease with which in vitro mutagenicity tests can be conducted is contributing to their use as screening tests for large numbers of substances. Those compounds with positive results

BEST COPY AVAILABLE

may then become candidates for more thorough acute and chronic in vivo testing. A recently published report of the National Academy of Science's (NAS) National Research Council concludes that these in vitro mutation tests can be considered "sufficiently reliable for most regulatory and manufacturing decisions.... It is neither necessary nor feasible to use mammals for initial screening..." although such in vivo tests should be reserved "for the relatively few cases where the results of simpler tests are ambiguous or the chemical in question is widely used." The NAS report, "Identifying and Estimating the Genetic Impact of Chemical Mutagens," can be ordered from NAS, 2101 Constitution Avenue, N.W., Washington, D.C. 20418.

Furthermore, as indicated in the above NTP statement, it is argued that somatic cell mutation may be indicative of potential carcinogenesis. Although there is a positive correlation between substances that yield positive in vitro mutagenesis results and those that are carcinogenic in whole animals and man, there still remains some disagreement as to the significance of in vitro data. Despite this disagreement, the literature contains a significant amount of in vitro data, and more continues to be published. Therefore, in an attempt to serve as a single reference source for various types of toxicity data, the Registry now includes insect, bacterial, and mammalian cell mutagenesis data, as well as the in vivo data. However, the Registry makes no attempt to evaluate the significance of these data as a predictor of either mutagenic or carcinogenic risk to humans. For additional information, the reader may wish to consult the NTP annual reports and technical bulletins. These are available from NTP, P.O. Box 12233, Research Triangle Park, North Carolina 27709.

Also included in this issue of the Registry are citations to reproductive effects data. Until January 1981, the RTECS file included reports of teratogenic effects only, which were defined as measurable nontransmissible changes produced in the offspring. The changes for which teratogenic citations were included were primarily developmental abnormalities, for example, cleft palate. However, because of the growing concern over potential reproductive hazards in the workplace, the Registry has reformatted and expanded the teratogen criteria to include citations to reports of all types of reproductive effects. These include effects on the parents (such as changes in fertility), as well as those on the developing conceptus and the offspring.

The reader is cautioned that the reproductive effects data cited in the Registry must not be treated indiscriminately and must be carefully evaluated before being used. As is the case for other RTECS toxicity data, the Registry simply serves as a pointer to the literature; the original reference should always be consulted. It should be recognized that reproductive systems of individual species and their responses to chemical exposures vary. The time when exposure occurs may significantly affect the outcome of a study because there are certain critical periods during a species' reproductive cycle. While there is some correlation between reproductive effects in humans and those in experimental animals, according to a January 1981 report prepared for the Council on Environmental Quality (CEQ) ("Chemical Hazards to Human Reproduction," available from CEQ, 722 Jackson Place, N.W., Washington, D.C. 20006), "...it will be difficult to determine in advance which species should be regarded as appropriate for predicting likely effects in humans....The present state of scientific knowledge of chemical hazards to reproduction is somewhat similar to that of chemical carcinogens in the late 1960s. The reader may wish to review the entire CEQ report for a discussion of issues pertinent to human reproductive hazards. The Registry makes no attempt to extrapolate the reproductive data cited in the file or to evaluate the significance of a substance as a potential reproductive risk to humans.

Reports of positive or equivocal tumorigenic effects are included in the Registry as described in paragraph 10 of the Detailed File Description. Other tumorigenic data may be found on the International Agency for Research on Cancer (IARC) review lines (see paragraph 14a of the Detailed File Description) and the NTP carcinogenesis bioassay status lines (see paragraph 17a).

It is important to note the significant difference between classifying toxicity reports and evaluating the potential of a chemical to produce tumorigenic, mutagenic, or reproductive effects in humans. In classifying reports, the editors of RTECS apply the technical criteria specified in the Detailed File Description to each report to allow extraction of data on a consistent basis. The evaluation of a substance's toxic potential is much more difficult and requires the collection, review, and analysis of all germane studies. The evidence must be correlated and judged by such parameters as appropriateness of the study to the decision process, relationship of the study design (e.g., animal model, route, and dose levels) to prediction of human response, the balance of positive and negative studies, purity of the substance tested, etc. The Registry makes no attempt to perform such a comprehensive evaluation nor does it classify substances as mutagens, teratogens, or tumorigens.

WORKPLACE RECOMMENDATIONS AND STANDARDS

The NIOSH Recommendations for Occupational Health Standards presents a summary of information previously published in Criteria Documents, Special Hazard Reviews, Occupational Hazard Assessments, Current Intelligence Bulletins, and Technical Guidelines. The table of Recommendations contained in this edition of RTECS was published in the Centers for Disease Control Morbidity and Mortality Weekly Report, January 31, 1985. It included the most recent NIOSH Recommended Exposure Limits (REL), and the OSHA Permissible Exposure Limits (PEL) for the included substances. Significant health effects and pertinent comments are also included. The full text of the Recommendations appear in Appendix I.

The permissible exposure levels of hazardous substances which have been adopted by OSHA to provide a safe, healthful work environment for all persons are cited in this Registry under the appropriate compound. These standards may be formulated by the Department of Labor on its own initiative, in response to recommendations of the NIOSH criteria documentation program. Approximately 500 such standards have been promulgated in Part 1910, as amended, of Title 29 of the Code of Federal Regulations (29 CFR 1910). They may also be found in the Federal Register, Volume 39, Number 125, June 27, 1974, and Volume 43, Number 237, December 8, 1978.

HEALTH HAZARD EVALUATIONS

Section 20(a)(6) of the Occupational Safety and Health Act of 1970 directs that the Secretary of

BEST COPY AVAILABLE

Health, Education, and Welfare "...shall determine following a written request by any employer or authorized representative of employees...whether any substance normally found in the place of employment has potentially toxic effects in such concentrations as used or found...." NIOSH responds to this legislative mandate by means of a Health Hazard Evaluation, as specified in 42 CFR 85, first published in the Federal Register, Volume 37, Number 215, pages 23639 through 23642, November 7, 197 . A Health Hazard Evaluation request will secure the assistance of NIOSH in determining the safety of a substance used in a specific occupational environment.

CONCLUSION

The editors request and will appreciate assistance from representatives of the industrial, academic, and governmental communities in supplying data for this Registry. Such assistance may be offered in the form of reprints of scientific publications, technical data sheets, sales or promotional material, other publicly available reference material, and data presented on unpublished studies. All material received will be considered in the public domain and as such may be made available to any persons or organizations. Data cited and published in the Registry will be selected according to the criteria presented herein. Identification of errors in the file is also solicited, as are any general comments or recommendations. Those who have contributed to this year's publication are listed in the Acknowledgments. All correspondence should be addressed to:

DETAILED FILE DESCRIPTION

SELECTION

1. Substances Included--For the purpose of this publication, the phrase "all known toxic substances" is interpreted by the editors to mean all mined, manufactured, processed, synthesized, and naturally occurring inorganic and organic compounds. The list of substances includes drugs, food additives, preservatives, ores, pesticides, dyes, detergents, lubricants, soaps, plastics, extracts from plants, microorganisms, and animals, plants and animals which are toxic by contact or consumption, pyrolysis products, and industrial intermediates and waste products from production processes. Some of the information in the file thus refers to materials whose composition is not precisely known. The chemical substances included in this list are assumed to exhibit the reported toxic effect in their pure state unless otherwise noted. However, even in the case of a supposedly "pure" substance, there is usually some degree of uncertainty as to its exact composition and the impurities which may be present. This possibility must be considered in attempting to interpret the data presented since the toxic effects observed could in some cases be caused by a contaminant.

2. Substances Excluded--Excluded from the Registry are trade name products representing compounded or formulated proprietary mixtures available as commercial products. These exclusions are necessary because of difficulties in assessing the contribution of each component of a mixture to that substance's toxicity and because a product's formulation is often changed by varying the components, their concentration, or the purity of the ingredients. Commercial product trade names are included, however, when they represent a single active chemical entity or a well-defined mixture of relatively constant composition. Radioactive substances are included but the effect reported is the chemically produced effect rather than the radiation effect.

FORMAT

This edition of the Registry lists all substance prime name and synonyms in the file in alphabetical order, ignoring special characters such as numerals, Greek letters, and prefixes indicating substituent locations, and stereochemical or other structural features. These components are taken into account for secondary ordering in ascending alphabetical and numerical order.

Each substance prime name and synonym is identified by a unique nine-position RTECS accession number (two letters and seven numerals) which varies directly with the alphabetic sequence of the name, so that toluene, for example, has a higher number than benzene. Each synonym is cross-referenced to its appropriate prime name accession number. The accession number is simply an identifier assigned alphabetically to each substance in the Registry. It is not intentionally related to the compound's toxicity or structure, although compounds with alphabetically similar names and, in some cases therefore, similar structures are grouped together. CAS numbers are also treated as synonyms, so that each CAS number is cross-referenced to the applicable RTECS accession number. The entire CAS number-RTECS number index, in numerical order by CAS number, appears in this volume.

For each prime name accession number the following data are provided when available: the substance prime name and synonyms; a description of the substance (where necessary); year and month when the RTECS data record was last updated; CAS number; molecular formula; molecular weight; primary irritation, mutation, reproductive, tumorigenic, and toxic dose data; and toxicological reviews, IARC monograph reviews, ACGIH Threshold Limit Values, toxicological reviews, existing Federal standards, the NIOSH criteria document and current intelligence programs, the NIOSH Manual of Analytical Methods, the National Toxicology Program's Carcinogenesis Testing Program, the EPA TSCA Inventory, and Genetic Toxicology, Section 8(a) and 8(e) status report. Each data line and citation is referenced by CODEN to the source from which the information was abstracted. A complete list of CODEN abbreviations and their respective titles are found at the end of Volume II. A complete list of standard abbreviations is located on the inside back cover of this volume. Sample data records, for the fictitious substance "RTECSIUM," are shown in Figures 1 through 5. Each field in the RTECS data record is discussed in detail below.

1. Substance Prime Name. The prime name of each substance in the Registry is derived from the nomenclature used by the American Chemical Society's

BEST COPY AVAILABLE

A. RTECS Accession Number, a sequence number assigned to each substance in the Registry.
1. Substance Prime Name.
2. Date when substance entry was last revised.
3. Chemical Abstracts Service Registry Number.
4. Molecular Weight of this substance.
5. Molecular or Elemental Formula of this substance.
6. Synonyms, common names, trade names, and other chemical names for this substance.
7. Skin and Eye Irritation Data.
8. Mutation Data.
9. Reproductive Effects Data.
10. Tumorigenic Data.
11. Toxicity Data.
12. CODEN, an acronym for the references from which the data and other citations were extracted.
13. Reviews of this substance.
14. Standards and Regulations for this substance promulgated by a Federal agency.
15. A Criteria Document supporting a recommended standard has been published by NIOSH.
16. NTP, NIOSH, and EPA Status information about this substance.

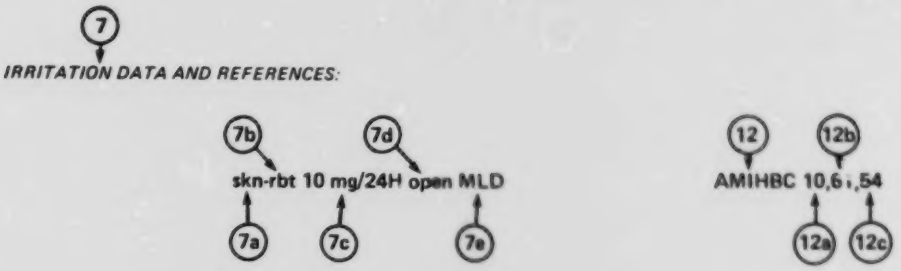
BEST COPY AVAILABLE



7. Header line for primary irritation data in the Registry. See paragraph 7 in text.

7a. This is an abbreviation for the tissue upon which the irritation test was conducted, either skin (skn) or eyes (eye).

7b. This is an abbreviation for the test species. See Table II for species listed in the Registry.

7c. This is the amount of substance used in the test for which results are reported, and may contain information about duration of exposure if different from the standard time of 72 hours.

7d. This is a descriptor to indicate differences in the test conditions from the standard protocol. Thus, "open" is used with skin irritation data to indicate a non-occluded Draize test. Other descriptors are "imm," "nse," and "rns."

7e. This is an abbreviation to indicate the severity of the irritation response as reported in the reference: mild (MLD), moderate (MOD), or severe (SEV).

12. This is the CODEN denoting the reference from which the irritation data line was derived. The complete citation for this CODEN is listed under RTECS Bibliographic References. See paragraph 12 in text.

12a. The volume number of the reference.

12b. The page number on which the reference starts.

12c. The last two digits of the year of publication, e.g., 54 = 1954.

BEST COPY AVAILABLE

Chemical Abstracts Service (CAS) in the 8th Collective Index (8CI) of Chemical Abstracts. If the 8CI nomenclature is not found then the 9CI or the 10CI name will be used. The names are given in the inverted form. The names are modified by NIOSH for certain substances to provide convenience to the user in grouping substances of similar occupational pertinence, such as metallic salts. The complete RTECS data record for each substance follows that substance's prime name.

Some entries, however, appear under the chemical or descriptive names used in the reference from which the toxic data were obtained. This is particularly true for those substances for which some aspects of their composition are in question, such as plant or animal extracts. These prime names are accompanied by a brief description or definition ("DEF") listing the source of the substance, a general statement of constituents, or other pertinent information, and the CODEN citation of the reference that contained the definition.

2. Update. This field specifies when the substance's data record was last changed. The format is YYMM, e.g., 8105 = May 1981. All 33,929 substances in the file as of January 1979 were initialized with a date of 7901. When a new substance is first input to the file, the update field is assigned the month of entry. When the data record is subsequently revised, the date is changed to reflect the month the change is made. Note that any revision, for example, deletion of an invalid synonym, addition of new toxicity data, change in the NTP status, or correction of a molecular formula, will cause the substance's update field to change.

3. The Chemical Abstracts Service (CAS) Registry Number is a numeric designation assigned by the American Chemical Society's Chemical Abstracts Service and uniquely identifies a specific chemical compound. This entry allows one to conclusively identify a substance regardless of the name or naming system used. Note that the CAS number - RTECS accession number index, beginning on page 1 of this volume, permits the reader to look up the RTECS data record for a substance when only its CAS number is known.

4. Molecular Weight is calculated from the molecular formula using standard elemental molecular weights (carbon = 12.01).

5. Molecular Formula designates the elemental composition of the substance and is structured according to the Hill System (see Journal of the American Chemical Society, 22(8):478-494, 1900) in which carbon and hydrogen (if present) are listed first, followed by the other elemental symbols in alphabetical order. The formula for compounds that do not contain carbon are ordered strictly alphabetically by element symbol. Compounds such as salts or those containing waters of hydration have molecular formulas incorporating the CAS dot-disconnect convention, in which the components are listed individually and separated by a period. The individual components of the formula are generally given in order of decreasing carbon atom count, and the component ratios given. A lower case "x" indicates that the ratio is unknown. A lower case "n" indicates a repeating, polymer-like structure. The formula is obtained from one of the cited references or a chemical reference text, or derived from the name of the substance.

6. Synonyms for the substance prime name are listed alphabetically according to the rule described under "FORMAT. "Synonyms include other chemical names, trade names, common or generic names, foreign names (with the language in parentheses), or codes, and are separated by asterisks. Some synonyms consist in whole or in part of registered trademarks. These trademarks are not identified as such in the RTECS file because of limitations in the computer and photocomposition character sets used to produce the Registry. The editors are aware of the problem of trademarks becoming generic trade names through common usage. While the Registry does not presently have a mechanism for noting trademarks, the lack of the appropriate registered trademark symbol does not imply that the trademarks contained herein are considered generic synonyms by NIOSH. Those trade-named products that are known to be obsolete, either because production and marketing of the substance has ceased or because the compound is currently manufactured under another name, are indicated with the abbreviation "(OBS.)".

The reader is cautioned that some synonyms, particularly common names, may be ambiguous and refer to more than one substance. These substances may or may not be chemically similar. For example, some common names are applied in the literature to both a particular compound and various metallic salts of that compound. In addition, the Registry's list of synonyms is not exhaustive, and the file may not include an entry for every existing use of a particular common name. Therefore, when using a synonym to look up data in the Registry, care must be taken to ensure that the substance record retrieved is for the particular substance in question and not for one with an identical common name.

7. Skin and Eye Irritation Data (see Figure 2). All primary irritation data appear under the header line "SKIN AND EYE IRRITATION DATA AND REFERENCES." Below this heading, each irritation data line includes, in sequence, the tissue tested (skin or eye); the species of animal tested; the total dose and where applicable, the duration of exposure; for skin tests only, whether open or occlusive; an interpretation of the irritation response severity when noted by the author; and the reference from which the information was extracted. Only positive irritation test results are included in the Registry.

Substances that are applied topically to the skin or to the mucous membranes can elicit either (a) systemic effects of an acute or chronic nature or (b) local effects, more properly termed "primary irritation." A primary irritant is a substance that, if present in sufficient quantity for a sufficient period of time, will produce a non-allergic, inflammatory reaction of the skin or of the mucous membrane at the site of contact. Primary irritants are further limited by the editors to those substances that are not corrosive. Hence, concentrated sulfuric acid is not classified in RTECS as a primary irritant.

a. Primary Skin Irritation. In experimental animals, a primary skin irritant is defined as a chemical substance that produces an irritant response on first exposure in a majority of the test subjects. However, in some instances compounds act more subtly and require either repeated contact or special environmental conditions (humidity, temperature, occlusion, etc.) to produce a response.

The most standard animal irritation test is the Draize procedure (Journal of Pharmacology and Experimental Therapeutics, 82: 377-390, 1944). This

BEST COPY AVAILABLE

procedure has been modified and adopted as a regulatory test by the Consumer Product Safety Commission (CPSC) in 16 CFR 1500.41 (formerly 21 CFR 191.11). In this test a known amount (0.5 ml of a liquid or 0.5 gm of a solid or semisolid) of the test substance is introduced under a one square inch gauze patch. The patch is applied to the skin (clipped free of hair) of twelve albino rabbits. Six rabbits are tested with intact skin and six with abraded skin. The abrasions are minor incisions made through the stratum corneum, but are not sufficiently deep to disturb the dermis or to produce bleeding. The patch is secured in place with adhesive tape, and the entire trunk of the animal is wrapped with an impervious material, such as rubberized cloth, for a 24-hour period. The animal is immobilized during exposure. After 24 hours the patches are removed and the resulting reaction evaluated for erythema, eschar, and edema formation. The reaction is again scored at the end of 72 hours (48 hours after the initial reading), and the two readings are averaged. A substance producing any degree of positive reaction is cited in the Registry as an irritant.

As the modified Draize procedure described above has become the standard test specified by the U.S. government, nearly all of the primary skin irritation data either strictly adheres to the test protocol or involves only simple modifications to it. When test procedures other than those described above are reported in the literature, appropriate codes are included in the data line to indicate those deviations.

The most common modification is the lack of occlusion of the test patch, so that the treated area is left open to the atmosphere. In such cases the notation "open" appears in the irritation data line. Another frequent modification involves whole arm or whole body immersion in the test substance or, more commonly, in a dilute aqueous solution of the test substance. This type of test is often conducted on soap and detergent solutions. Immersion data are identified by the abbreviation "imm" in the data line.

The dose reported is based first on the lowest dose producing an irritant effect and second on the latest study published. The dose is expressed as follows:

(1) Single application by the modified Draize procedure is indicated by only a dose amount. If no exposure time is given, then the data are for the standard 72-hour test. For test times other than 72 hours, the dose data is given in mg (or an appropriate unit)/duration of exposure, e.g., 10 mg/24H.

(2) Multiple applications involve administration of the dose in divided portions applied periodically. The total dose of test substance is expressed in mg (or an appropriate unit)/duration of exposure, with the symbol "I" indicating intermittent exposure, e.g., 5 mg/6D-I.

The method of testing substances for primary skin irritation given in the Code of Federal Regulations does not include an interpretation of the response. However, some authors do include a subjective rating of the irritation observed. If such a severity rating is given, it is included in the data as mild ("MLD"), moderate ("MOD"), or severe ("SEV"). The Draize procedure employs a rating scheme which is included here for informational purposes only, since other researchers may not categorize irritation response in this manner.

Category (Draize)	Code	Skin Reaction
Mild	MLD	Well defined erythema and slight edema (edges of area well defined by definite raising)
Moderate	MOD	Moderate to severe erythema and severe edema (area raised approximately 1 mm)
Severe	SEV	Severe erythema (Beet redness) to slight eschar formation (injuries in depth) and severe edema (raised more than 1 mm and extending beyond area of exposure)

b. Primary Eye Irritation. In experimental animals, a primary eye irritant is defined as a chemical substance that produces an irritant response in the test subject on first exposure. Eye irritation study procedures developed by Draize have been modified and adopted as a regulatory test by CPSC in 16 CFR 1500.42. In this procedure, a known amount of the test material (0.1 ml of a liquid or 100 mg of a solid or paste) is placed in one eye of each of six albino rabbits; the other eye remains untreated, serving as a control. The eyes are not washed after instillation and are examined at 24, 48, and 72 hours for ocular reaction. After the recording of ocular reaction at 24 hours, any or all eyes may be further examined following the application of fluorescein. Any or all eyes may also be washed with a sodium chloride solution (U.S.P. or equivalent) after the 24-hour reaction has been recorded.

A test is scored positive if any of the following effects are observed: (1) ulceration (besides fine stippling); (2) opacity of the cornea (other than slight dulling of normal luster); (3) inflammation of the iris (other than a slight deepening of the rugae or circumcorneal injection of the blood vessel); (4) swelling of the conjunctiva (excluding the cornea and iris) with eversion of the eyelid; or (5) a diffuse crimson-red color with individual vessels not clearly identifiable. A substance is an eye irritant if four of six rabbits score positive. It is considered a nonirritant if none or only one of six animals exhibits irritation. If intermediate results are obtained, the test is performed again. For the purpose of RTECS, substances producing any degree of irritation in the eye are identified in the Registry as irritants. When an author has designated a substance as either a mild, moderate, or severe eye irritant, this designation is also reported.

The dose reported is based first on the lowest dose producing an irritant effect and second on the latest study published. Single and multiple applications are indicated as described above under "Primary Skin Irritation." Test times other than 72 hours are noted in the dose. All eye irritant test exposures are assumed to be continuous, unless the reference states that the eyes were washed after instillation. In this case, the notation "rns" (rinsed) is included in the data line.

c. Species Exposed. Since Draize procedures for determining both skin and eye irritation specify rabbits as the test species, most of the animal irritation data in the Registry are for rabbits, although any of the species listed in Table II may be used. The editors endeavor to include as much human

BEST COPY AVAILABLE

data as possible, since this information is directly applicable to occupational exposure. Much of this data comes from studies conducted on volunteers (such as for cosmetic or soap ingredients) or from persons accidentally exposed. When an accidental exposure, such as a spill, is cited, the data line includes the abbreviation "nse" (non-standard exposure). In these cases it is often very difficult to determine the precise amount of the substance to which the individual was exposed. Therefore, for accidental exposures we have generally provided an estimate of the concentration or strength of the substance, rather than a total dose amount.

8. Mutation Data (see Figure 3). All mutation data for both whole animal and in vitro studies appear under the header line "MUTATION DATA AND REFERENCES". Below this heading, each mutation data line includes, in sequence, the mutation test system utilized, the species of the tested organism (and where applicable, the route of administration or cell type), the exposure concentration or dose, and the reference from which the information was extracted. Only positive mutation test results are cited.

A mutation is defined as any heritable change in genetic material. Unlike irritation, reproductive, tumorigenic, and toxic dose data (see paragraphs 7, 9, 10, and 11, respectively), which report the results of whole animal studies mutation data also include studies on lower organisms such as bacteria, molds, yeasts, and insects, as well as in vitro mammalian cell cultures. Studies of plant mutagenesis are not now included in the Registry. No attempt is made to evaluate the significance of the data or to rate the relative potency of the compound as a mutagenic risk to man.

Each element of the mutation data line is discussed below.

a. Mutation Test System. A number of test systems are used to detect genetic alterations caused by chemical substances. Those systems specifically cited in the RTECS file are listed below; others found in the literature have been grouped together under the general term "other mutation test systems" (oms). Each test system is identified by the 3-letter code shown in parentheses. For additional information about mutation tests, the reader may wish to consult the Handbook of Mutagenicity Test Procedures, edited by B. J. Kilbey, M. Legator, W. Nichols, and C. Ramel (Amsterdam: Elsevier Scientific Publishing Company/North-Holland Biomedical Press, Second Edition, 1984.)

(1) Mutation in Microorganisms (mmo) - System utilizes the detection of heritable genetic alterations in microorganisms which have been exposed directly to the chemical substance.

(2) Microsomal Mutagenicity Assay (mma) - System utilizes an in vitro technique which allows enzymatic activation of promutagens in the presence of an indicator organism in which induced mutation frequencies are determined.

(3) Micronucleus Test (mnt) - System utilizes the fact that chromosomes or chromosome fragments may not be incorporated into one or the other of the daughter nuclei during cell division.

(4) Specific Locus Test (slt) - System utilizes a method for detecting and measuring rates of mutation at any or all of several recessive loci.

(5) DNA Damage (dnd) - System detects the damage to DNA strands including strand breaks, crosslinks, and other abnormalities.

(6) DNA Repair (dnr) - System utilizes methods of monitoring DNA repair as a function of induced genetic damage.

(7) Unscheduled DNA Synthesis (dns) - System detects the synthesis of DNA during usually non-synthetic phases.

(8) DNA Inhibition (dni) - System detects the inhibition of DNA synthesis.

(9) Gene Conversion and Mitotic Recombination (mrc) - System utilizes unequal recovery of genetic markers in the region of the exchange during genetic recombination.

(10) Cytogenetic Analysis (cyt) - System utilizes cultured cells or cell lines to assay for chromosomal aberrations.

(11) Sister Chromatid Exchange (sce) - System detects the interchange of DNA in cytological preparations of metaphase chromosomes between replication products at apparently homologous loci.

(12) Sex Chromosome Loss and Nondisjunction (sln) - System measures the nonseparation of homologous chromosomes at meiosis and mitosis.

(13) Dominant Lethal Test (dlt) - A dominant lethal is a genetic change in a gamete that kills the zygote produced by that gamete. In mammals, the dominant lethal test measures the reduction of litter size by examining the uterus and noting the number of surviving and dead implants.

(14) Mutation in Mammalian Somatic Cells (msc) - System utilizes the induction and isolation of mutants in cultured mammalian cells by identification of the gene change.

(15) Host-Mediated Assay (hma) - System uses two separate species, generally mammalian and bacterial, to detect heritable genetic alteration caused by metabolic conversion of chemical substances administered to host mammalian species in the bacterial indicator species.

(16) Sperm Morphology (spm) - System measures the departure from normal in the appearance of sperm.

(17) Heritable Translocation Test (trn) - Test measures the transmissibility of induced translocations to subsequent generations. In mammals, the test uses sterility and reduced fertility in the progeny of the treated parent. In addition, cytological analysis of the F1 progeny or subsequent progeny of the treated parent is carried out to prove the existence of the induced translocation. In Drosophila, heritable translocations are detected genetically using easily distinguishable phenotypic markers, and these translocations can be verified with cytogenetic techniques.

(18) Oncogenic Transformation (otr) - System utilizes morphological criteria to detect cytological differences between normal and transformed tumorigenic cells.

BEST COPY AVAILABLE

(19) Phage Inhibition Capacity (pic) - System utilizes a lysogenic virus to detect a change in the genetic characteristics by the transformation of the virus from noninfectious to infectious.

(20) Body Fluid Assay (bfa) - System uses two separate species, usually mammalian and bacterial. Test substance is first administered to host, from whom body fluid (e.g., urine, blood) is subsequently taken. This body fluid is then tested in vitro, and mutations are measured in the bacterial species.

b. Those test species that are peculiar to mutation data cited in the Registry are designated by the 3-letter codes shown below. Other species common to both mutation and other types of toxicity data are listed in Table II.

	Code	Species
Bacteria:	bcs	Bacillus subtilis
	esc	Escherichia coli
	hmi	Haemophilus influenzae
	klp	Klebsiella pneumoniae
	sat	Salmonella typhimurium
	srm	Serratia marcescens
Molds:	asn	Aspergillus nidulans
	nsc	Neurospora crassa
Yeasts:	smc	Saccharomyces cerevisiae
	ssp	Schizosaccharomyces pombe
Protozoa:	clr	Chlamydomonas reinhardi
	eug	Euglena gracilis
	omi	Other microorganisms
Insects:	dmg	Drosophila melanogaster
	dpo	Drosophila pseudo-obscura
	grh	Grasshopper
	slw	Silkworm
	oin	Other insects
Fish:	sal	Salmon
	ofs	Other fish

If the test organism is a cell type from a particular species (generally mammalian), the parent species is reported followed by a colon and the cell type designation. For example, human leukocytes are coded "hum:leu". The various cell types currently cited in the Registry are listed below.

Designation	Cell Type
ast	Ascites tumor
bmr	bone marrow
emb	embryo
fbr	fibroblast
hla	HeLa cell
kdy	kidney
leu	leukocyte
lng	lung
lvr	liver
lym	lymphocyte
mmr	mammary gland
ovr	ovary
spr	sperm
tes	testis
oth	other cell types not listed above

In the case of host-mediated and body fluid assays, both the host organism and the indicator organism are given as follows: host organism/indicator organism, e.g., "ham/sat" for a test in which hamsters were exposed to the test chemical and S. typhimurium was used as the indicator organism.

For in vivo mutagenic studies, the route of administration is specified following the species designation, e.g., "mus-orl" for oral administration to mice. See Table I for a complete list of routes cited in the Registry. The route of administration is not specified for in vitro data.

c. Units of Exposure. The lowest dose producing a positive effect is cited. The author's calculations are used to determine the lowest dose at which a positive effect was observed. If the author fails to state the lowest effective dose, two times the control dose will be used. Ideally, the dose should be reported in universally accepted toxicological units such as milligrams of test chemical per kilogram of test animal body weight. While this is possible in cases where the actual intake of the chemical by an organism of known weight is reported, it is not possible in many systems using insect and bacterial species. In cases where a dose is reported or where the amount can be converted to a dose unit, it is normally listed as milligrams per kilogram (mg/kg). However, micrograms (ug), nanograms (ng), or picograms (pg) per kilogram may also be used for convenience of presentation. Concentrations of gaseous substances in air are listed as parts per hundred (pph), per million (ppm), per billion (ppb), or per trillion (ppt).

Test systems using microbial organisms traditionally report exposure data as an amount of chemical per liter (L) or amount per plate, well, disc, or tube. The amount may be on a weight (gm, mg, ug, ng, or pg) or molar (millimole (mmol), microwole (umol), nanomole (nmol), or picomole (pmol)) basis. These units describe the exposure concentration rather than the dose actually taken up by the test species. Insufficient data currently exist to permit the development of dose amounts from this information. In such cases, therefore, the substance concentration units used by the author are reported.

Since the exposure values reported in host-mediated and body fluid assays are doses delivered to the host organism, no attempt is made to estimate the exposure concentration to the indicator organism. The exposure values cited for host-mediated assay data are in units of milligrams (or other appropriate unit of weight) of substance administered per kilogram of host body weight or in parts of vapor or gas per million (ppm) parts of air (or other appropriate concentrations) by volume.

9. Reproductive Effectsd Data (see Figure 4). All reproductive effects data appear under the header line "REPRODUCTIVE EFFECTS DATA AND REFERENCES". Below this heading, each reproductive effects data line includes, in sequence, the reproductive effects code, the route of exposure, the species of animal tested, the type of dose, the total dose amount administered, the time and duration of administration, and the reference from which the information was extracted. Only positive reproductive effects data for mammalian species are cited in the Registry. Because of differences in the reproductive systems among species and the systems' varying responses to

BEST COPY AVAILABLE

chemical exposures, no attempt is made to extrapolate animal data or to evaluate the significance of a substance as a reproductive risk to humans.

The reader should note that all toxicity data lines (see paragraph 11) that were coded "TFX:TER" in previous issues of the Registry have been moved into this reproductive effects data section. In addition, new reproductive effects data lines are being added to this portion of the file.

Each element of the reproductive effects data line is discussed below.

a. Reproductive Effects Code. For purposes of the Registry, the reproductive effects for which dose data are cited have been grouped into seven categories: paternal effects, maternal effects, effects on fertility, effects on the embryo or fetus, specific developmental abnormalities, tumorigenic effects, and effects on the newborn. Within these seven categories, 65 specific effects have been defined. Each effect is identified by a three-position alphanumeric code. The reproductive effects and their corresponding codes are shown in Table IV. The reproductive effects code is a subset of and is identical in format to the Toxic Effects Code (TEC) described in paragraph 11a below. The effects cited on a given data line were reported to occur in the species and at the dose level given on that line. Up to three reproductive effects codes can appear on a single data line. If more than three reproductive effects are reported for the same route-species-dose level-duration combination, duplicate lines will appear in this section of the file to allow complete coding of the reproductive effects.

b. Route of Exposure or Administration. See Table I for a complete list of abbreviations and definitions of the various routes of exposure reported in the Registry. For reproductive effects data, the specific route is listed in RTECS either when the substance was administered to only one of the parents or when the substance was administered to both parents by the same route. However, if the substance was administered to each parent by a different route, the route is indicated as "mul" (multiple).

c. Species Exposed. Reproductive effects data are cited in the Registry for mammalian species only. Species abbreviations are the same as those used for toxic dose data and are shown in Table II. Also shown in Table II are approximate gestation periods.

d. Type of Exposure. Only two types of exposure, TDLo and TCLo, are used to describe the dose amounts reported for reproductive effects data. These two terms, which are also used to describe toxic dose data, are defined in paragraph 11d below.

e. Dose Amounts and Units. The total dose amount that was administered to the exposed parent is given. If the substance was administered to both parents, the individual amounts to each parent have been added together and the total amount shown. Where necessary, appropriate conversion of dose units has been made. The dose amounts listed are those for which the reported effects are statistically significant. However, human case reports are cited even when no statistical tests can be performed. The statistical test is that used by the author. If no statistic is reported, a Fisher's Exact Test is applied with significance at the 0.05 level, unless the author makes a strong case for significance at some other level.

Dose units are usually given as an amount administered per unit body weight or as parts of vapor or gas per million parts of air by volume. A complete description of dose units is given in paragraph 11e below. There is no limitation on either the quantity or concentration of the dose or the duration of exposure reported to have caused the reproductive effect(s).

f. Time and Duration of Treatment. The time when a substance is administered to either or both parents may significantly affect the results of a reproductive study, because there are differing critical periods during the reproductive cycles of each species. Therefore, to provide some indication of when the substance was administered, which should facilitate selection of specific data for analysis by the user, a series of up to four terms follows the dose amount. These terms indicate to which parent(s) and at what time the substance was administered. The terms takethe general form:

(uD male/vD pre/w-xD preg/yD post)

where u = total number of days of administration to male prior to mating

v = total number of days of administration to female prior to mating

w = first day of administration to pregnant female during gestation

x = last day of administration to pregnant female during gestation

y = total number of days of administration to lactating mother after birth of offspring

If administration is to the male only, then only the first of the above four terms is shown following the total dose to the male, e.g., 10 mg/kg (5D male). If administration is to the female only, then only the second, third, or fourth term, or any combination thereof, is shown following the the total dose to the female, e.g.,

10 mg/kg (3D pre)
10 mg/kg (3D pre/4-7D preg)
10 mg/kg (3D pre/4-7D preg/5D post)
10 mg/kg (3D pre/5D post)
10 mg/kg (4-7D preg)
10 mg/kg (4-7D preg/5D post)
10 mg/kg (5D post) (NOTE: This example indicates administration to the lactat- mother only after birth of the offspring.)

If administration is to both parents, then the first term and any combination of the last three terms are listed, e.g., 10 mg/kg (5D male/3D pre/4-7D preg). If administration is continuous through two or more of the above periods, the above format is abbreviated by replacing the slash (/) with a dash (-). For example, 10 mg/kg (3D pre-5D post) means a total of 10 mg/kg administered to the female for three days prior to mating, on each day during gestation, and for five days following birth. Approximate gestation periods for various species are shown in Table II.

g. Multigeneration Studies. Some reproductive studies entail administration of a substance to several consecutive generations, with the

BEST COPY AVAILABLE

reproductive effects measured in the final generation. The protocols for such studies vary widely. Therefore, because of the inherent complexity and variability of these studies, they are cited in RTECS in a simplified format as follows. The specific route of administration is reported if it was the same for all parents of all generations; otherwise the abbreviation "mul" is used. The total dose amount shown is that administered to the F0 generation only (as described in paragraph 9e above); doses to the Fn (where n = 1, 2, 3, etc.) generations are not reported. The time and duration of treatment for multigeneration studies are not included in the data line. Instead, the dose amount is followed by the abbreviation "(MGN)", e.g., 10 mg/kg (MGN). This code indicates a multigeneration study, and the reader must consult the cited reference for complete details of the study protocol.

10. Tumorigenic Data. All tumorigenic data appear under the header line "TUMORIGENIC DATA AND REFERENCES." The format of this data line is identical to that of the toxicity data line, which is described in detail in paragraph 11. Briefly, each tumorigenic data line includes, in sequence, the Toxic Effects Code (TEC), the route of exposure, the species of animal studied, the type of dose (either TDLo or TCLo), the total dose amount administered, the duration of exposure, and the reference from which the information was extracted. Only positive or equivocal tumorigenic reports are cited in this section. For other information about tumorigenicity, the reader should also see the IARC review lines (see paragraph 14a), the ACGIH review lines (see paragraph 14c), and the NTP status lines (see paragraph 16a).

The reader should note that the tumorigenic data section does not represent a new type of data in the Registry. Rather, this section includes those data lines that previously appeared in the toxicity data section (see paragraph 11) and that were coded "TFX:CAR," "TFX:NEO," or "TFX:ETA." To conform with the new TEC format (see paragraph 11a below), these lines are now coded with the Toxic Effects Codes V01, V02, or V03, respectively. The "CAR," "NEO," and "ETA" codes are no longer used. In addition, the specific organ systems affected are also indicated. For ease of presentation, all these tumorigenic data lines have been grouped together in this section of the file. All future tumorigenic citations will also appear in this section.

The importance attached to reports of the carcinogenic activity of substances necessitates a more detailed discussion of the criteria used to include this type of data in the Registry. Tumorigenic citations are classified according to the reported results of the study only to aid the reader in selecting appropriate references for in-depth review and evaluation. In past editions of the Registry, the two classifications used were CAR, indicating a positive carcinogenic finding, and NEO, indicating a study producing benign tumors or one lacking complete documentation. Beginning in October 1978, a third classification, ETA (equivocal tumorigenic agent), was added to denote those studies reporting uncertain, but seemingly positive, results. The criteria for these three classifications are listed below. As explained in the Introduction, these criteria are used to abstract the data on a consistent basis and do not represent a comprehensive evaluation of a substance's tumorigenic potential to humans.

Because of the increasing concern with carcinogens in the occupational environment, the Registry now cites multiple studies in which tumorigenic responses were reported. That is, for a given substance, a particular route-species combination may be cited more than once if the results of the multiple studies are coded V01, V02, or V03. These multiple entries have been cited simply with a toxicity measure of "TD" (toxic dose) or "TC" (toxic concentration).

The following 9 technical criteria are used by RTECS to abstract the toxicological literature and classify studies that report positive tumorigenic responses. No attempts are made either to evaluate the various test procedures or correlate results from different experiments.

(1) A citation is coded "V01" (carcinogenic) when review of an article reveals that all of the following criteria are satisfied:

(a) A statistically significant increase in the incidence of tumors in the test animals. The statistical test is that used by the author. If no statistic is reported, a Fisher's Exact Test is applied with significance at the 0.05 level, unless the author makes a strong case for significance at some other level.

(b) A control group of animals is used and the treated and control animals are maintained under identical conditions.

(c) The sole experimental variable between the groups is the administration or non-administration of the test substance (see (9) below).

(d) The tumors consist of autonomous populations of cells of abnormal cytology capable of invading and destroying normal tissues, or the tumors metastasize as confirmed by histopathology.

(2) A citation is coded "V02" (neoplastic) when review of an article reveals that all of the following criteria are satisfied:

(a) A statistically significant increase in the incidence of tumors in the test animals. The statistical test is that used by the author. If no statistic is reported, a Fisher's Exact Test is applied with significance at the 0.05 level, unless the author makes a strong case for significance at some other level.

(b) A control group of animals is used, and the treated and control animals are maintained under identical conditions.

(c) The sole experimental variable between the groups is the administration or non-administration of the test substance (see (9) below).

(d) The tumors consist of cells that closely resemble the tissue of origin, that are not grossly abnormal cytologically, that may compress surrounding tissues, but that neither invade tissues nor metastasize; or

(e) The tumors produced cannot definitely be classified as either benign or malignant.

(3) A citation is coded "V03" (equivocal tumorigenic agent) when some evidence of tumorigenic activity is presented, but one or more of the

BEST COPY AVAILABLE

criteria listed in (1) or (2) above is lacking. Thus, a report with positive pathological findings, but with no mention of control animals, is coded "V03". Reports in which the results are not interpretable are not cited in the Registry.

(4) Since an author may make statements or conclusions based on a larger context than that of the particular data reported, papers in which the author's conclusions differ substantially from the evidence presented in the paper are subject to review by the RTECS Editorial Review Board.

(5) All doses except those for transplacental carcinogenesis are reported in RTECS in one of the following formats.

(a) For all routes of administration other than inhalation:

cumulative dose in mg (or appropriate unit)/kg/duration of administration.

Whenever the dose reported in the reference is not in the above units, conversion to this format is made based on the information given in paragraph 9d above. The total cumulative dose is derived from the lowest dose level that produces tumors in the test group.

(b) For inhalation experiments:

concentration in ppm (or mg/m3)/total duration of exposure.

The concentration refers to the lowest concentration that produces tumors.

(6) Transplacental carcinogenic doses are reported in RTECS in one of the following formats.

(a) For all routes of administration other than inhalation:

cumulative dose in mg/kg/(time of administration during pregnancy.)

The cumulative dose is derived from the lowest single dose that produces tumors in the offspring. The test chemical is administered to the mother.

(b) For inhalation experiments:

concentration in ppm (or mg/m3)/time of exposure during pregnancy or lactation.

The concentration refers to the lowest concentration that produces tumors in the offspring. The mother is exposed to the test chemical either during pregnancy or lactation.

(7) For the purposes of RTECS, all test chemicals are reported as pure, unless otherwise stated by the authors. This does not rule out the possibility that unknown impurities may have been present.

(8) A mixture of compounds whose test results satisfy the criteria in (1), (2), or (3) above is included if the composition of the mixture can be clearly defined.

(9) For tests involving promoters or initiators, a study is included if the following conditions are satisfied (in addition to the criteria in (1), (2), or (3) above):

(a) The test chemical is applied first, followed by an application of a standard promoter. A positive control group in which the test animals are subjected to the same standard promoter under identical conditions is maintained throughout the duration of the experiment. The data are not used if no mention of positive and negative control groups is made in the reference.

(b) A known carcinogen is first applied as an initiator, followed by application of the test chemical as a promoter. A positive control group in which the test animals are subjected to the same initiator under identical conditions is maintained throughout the duration of the experiment. The data are not used if no mention of positive and negative control groups is made in the reference.

11. Toxicity Data (see Figure 5). All other toxic dose data not included in paragraphs 7 through 10 above appear under the header line "TOXICITY DATA AND REFERENCES." Below this heading, each toxic dose data line includes, in sequence, the Toxic Effects Code; the route of exposure; the species of animal studied; the type of dose; the amount of substance per body weight or concentration per unit of air volume and, where applicable, the duration of exposure; and the reference from which the information was extracted. Only positive toxicity test results are cited in this section.

Each element of the toxic dose data line is discussed below.

a. Toxic Effects Code. In previous issues of the Registry, descriptions of toxic effects reported in the literature were coded in two different formats. The original "notations descriptive of the toxicology" were listed following the dose amount as "TFX:ZZZ," where "ZZZ" was one of 28 different organ systems or toxic effects. Beginning in October 1980, this coding system was significantly expanded and reformatted to include over 400 different effects. These effects are noted in the Registry by means of an alphanumeric Toxic Effects Code (TEC). All former "TFX" codes have been converted to TEC's, and new TEC data have been added. The TEC permits a detailed coding of the toxic effects reported in the literature and is included for both human and animal data.

Unlike the former TFX notations, the TEC is the first entry on the toxic dose line; it appears to the left of the route of administration. Each TEC is made up of one or more code segments, each of which contains three characters. Each TEC, which may contain as many as three code segments, is preceded by a single digit (1, 2, or 3) that indicates the number of segments. For example, the entry "2J18K13" indicates 2 code segments: J18 and K13. An explanation of the individual code segments is given below.

The first position of each segment is alphabetic and describes an organ, tissue, or functional system, or other major physiological or behavioral grouping. Positions two and three are numeric damage codes that specify individual toxic effects within each system. A complete list of TEC's, including all major system groupings and individual damage codes, appears in Table III. Using Table III to decode the preceding

BEST COPY AVAILABLE

example (2J18K13), the reader finds that the "J" represents the lung as the affected organ and the "18" indicates pleural thickening. For K13, "K" represents the gastrointestinal system and "13" means nausea or vomiting.

In using the codes, the reader should be aware of the following restrictions:

(1) The TEC coding effort is relatively recent, so that not all data lines include TEC's. All new toxic dose lines are being coded as they are entered into the file. Existing data lines will be reviewed and coded as time and funds permit.

(2) Specific TEC's included in Table III may change as more experience is gained in coding the literature. Some may be deleted, while others may be added. The TEC is not static and will be changed to reflect the information reported in the literature. The four-digit number to the left of each code in Table III is the date (in YYMM format) when a particular code was last changed or added. Like the update field (see paragraph 2), it can be monitored so that changes to the TEC during a specific period can be found.

(3) An asterisk (*) in the TEC field means that the cited reference was reviewed but contained no description of toxic effects other than the lethal dose value listed.

(4) A blank TEC field means that the reference has not yet been reviewed and coded for toxic effects.

(5) TEC's listed on each line describe effects reported only for the route and species specified on that line.

(6) The TEC listed in the Registry should not be viewed as an exhaustive representation of all the potential toxic effects of a compound. This caution results from two considerations. The first is that each RTECS dose line is limited to a maximum of three code segments. For studies in which more than three effects were reported, only the most significant will be listed. Second, the effects are limited to those that are reported in studies that meet the basic selection criteria for inclusion in the Registry; i.e., lowest dose for a given route-species combination. This restriction is important because, for example, studies done to determine acute LD50 values often report little other information besides the LD50 itself.

b. Route of Exposure or Administration. Although many exposures to substances in the industrial community occur via the respiratory tract or skin, most studies in the published literature report exposures of experimental animals in which the test substances were introduced primarily through the mouth by pills, in food, in drinking water, or by intubation directly into the stomach. The abbreviations and definitions of the various routes of exposure reported in the Registry are found in Table I.

c. Species Exposed. Since the effects of exposure of humans are of primary concern, we have indicated, when available, whether the results were observed in man, woman, child, or infant. If no such distinction was made in the reference, the term "hmn" (human) is used. However, the results of studies on rats or mice are the most frequently reported and hence provide the most useful data for comparative purposes. The species and abbreviations used are listed alphabetically in Table II.

d. Description of Exposure. In order to better describe the administered dose reported in the literature, six abbreviations are used. These terms indicate whether the dose caused death (LD) or other toxic effects (TD) and whether it was administered as a lethal concentration (LC) or toxic concentration (TC) in the inhaled air. In general, the term "Lo" is used where the number of subjects studied was not a significant number from the population or the calculated percentage of subjects showing an effect was listed as 100. The definition of terms is as follows:

TDLo--Toxic Dose Low--the lowest dose of a substance introduced by any route, other than inhalation, over any given period of time and reported to produce any toxic effect in humans or to produce tumorigenic or reproductive effects in animals or humans.

TCLo--Toxic Concentration Low--the lowest concentration of a substance in air to which humans or animals have been exposed for any given period of time that has produced any toxic effect in humans or produced a tumorigenic or reproductive effect in animals or humans.

LDLo--Lethal Dose Low--the lowest dose (other than LD50) of a substance introduced by any route, other than inhalation, over any given period of time in one or more divided portions and reported to have caused death in humans or animals.

LD50--Lethal Dose Fifty--a calculated dose of a substance which is expected to cause the death of 50% of an entire defined experimental animal population. It is determined from the exposure to the substance by any route other than inhalation of a significant number from that population. Other lethal dose percentages, such as LD1, LD10, LD30, and LD99, may be published in the scientific literature for the specific purposes of the author. Such data would be published in the Registry if these figures, in the absence of a calculated lethal dose (LD50), were the lowest found in the literature.

LCLo--Lethal Concentration Low--the lowest concentration of a substance in air, other than LC50, which has been reported to have caused death in humans or animals. The reported concentrations may be entered for periods of exposure which are less than 24 hours (acute) or greater than 24 hours (subacute and chronic).

LC50--Lethal Concentration Fifty--a calculated concentration of a substance in air, exposure to which for a specified length of time is expected to cause the death of 50% of an entire defined experimental animal population. It is determined from the exposure to the substance of a significant number from that population.

BEST COPY AVAILABLE

The following table summarizes the above information:

Category	Exposure Time	Route of Exposure	TOXIC EFFECTS Human	Animal
TDLo	Acute or Chronic	All except inhalation	Any Non-Lethal	Reproductive Tumorigenic
TCLo	Acute or Chronic	Inhalation	Any Non-Lethal	Reproductive Tumorigenic
LDLo	Acute or Chronic	All except inhalation	Death	Death
LD50	Acute	All except inhalation	Not Applicable	Death (Statistically Determined)
LCLo	Acute or Chronic	Inhalation	Death	Death
LC50	Acute	Inhalation	Not Applicable	Death (Statistically Determined)

e. Units of Dose Measurement. As in almost all experimental toxicology, the doses given are expressed in terms of the quantity administered per unit body weight, or quantity per skin surface area, or quantity per unit volume of the respired air. In addition, the duration of time over which the dose was administered is also listed, as needed. Dose amounts are generally expressed as milligrams per kilogram (mg/kg). In some cases, because of dose size and its practical presentation in the file, grams per kilogram (gm/kg), micrograms per kilogram (ug/kg), or nanograms per kilogram (ng/kg) are used. Volume measurements of dose were converted to weight units by appropriate calculations. Densities were obtained from standard reference texts. Where densities were not readily available, all liquids were assumed to have a density of one gram per milliliter. Twenty drops of liquid are assumed to be equal in volume to one milliliter.

All body weights have been converted to kilograms (kg) for uniformity. For those references in which the dose was reported to have been administered to an animal of unspecified weight or a given number of animals in a group (e.g., feeding studies) without weight data, the weights of the respective animal species were assumed to be those listed in Table II and the dose is listed on a per kilogram body weight basis. Assumptions for daily food and water intake are found in Table II to allow approximating doses for humans and species of experimental animals where the dose was originally reported as a concentration in food or water. The values presented are selections which are reasonable for the species and convenient for dose calculations.

Concentrations of a gaseous substance in air are generally listed as parts of vapor or gas per million parts of air by volume (ppm). However, parts per hundred (pph or per cent), parts per billion (ppb), or parts per trillion (ppt) may be used for convenience of presentation. If the substance is a solid or a liquid, the concentrations are listed preferably as milligrams per cubic meter (mg/m3) but may, as applicable, be listed as micrograms per cubic meter (ug/m3), nanograms per cubic meter (ng/m3), or picograms per cubic meter (pg/m3) of air. For those cases in which other measurements of contaminants are used, such as the number of fibers or particles, the measurement is spelled out.

Where the duration of exposure is available, time is presented as minutes (M), hours (H), days (D), weeks (W), or years (Y). Additionally, continuous (C) indicates that the exposure was continuous over the time administered, such as ad libitum feeding studies or 24-hour, 7-day per week inhalation exposures. Intermittent (I) indicates that the dose was administered during discrete periods, such as daily, twice weekly, etc. In all cases, the total duration of exposure appears first after the kilogram body weight and slash, followed by descriptive data; e.g., 10 mg/kg/3W-I means ten milligrams per kilogram body weight administered over a period of three weeks, intermittently in a number of separate, discrete doses. This description is intended to provide the reader with enough information for an approximation of the experimental conditions, which can be further clarified by studying the reference cited.

f. Duration of Exposure. The duration of exposure is included to give an indication of the testing period during which the animal was exposed to this total dose.

g. Frequency of Exposure. Frequency of exposure to the test substance varies depending on the nature of the experiment. For the purpose of the Registry, frequency of exposure is given in the case of an inhalation experiment, for human exposures (where applicable), or where a reproductive or tumorigenic effect is specified (see paragraphs 9 and 10, respectively).

12. Cited Reference. The final entry on the irritation, mutation, reproductive, tumorigenic, and toxicity data lines is the reference from which the information was extracted. All references cited are publicly available. No governmental classified documents have been used for source information. All references have been given a unique six-letter CODEN character code (derived from the American Society for Testing and Materials CODEN for Periodical Titles and the CAS Source Index), which identifies periodicals, serial publications, and individual published works. For those references for which no CODEN was found, the corresponding six-letter code includes asterisks (*) in the last one or two positions following the first four or five letters of an acronym for the publicetion title. Following the CODEN designation (for most entries) is the number of the volume, followed by a comma; the page number of the first page of the article, followed by a comma; and two numbers, indicating the year of publication in this century. Where the cited reference is a report, the report number is listed. When contributors have provided information on their unpublished studies, the CODEN consists of the first three letters of the last name, the initials of the first and middle names, and a number (#) sign. The date of the letter supplying the information is listed. All CODEN acronyms are listed in alphabetical order and defined in the complete "CODEN BIBLIOGRAPHIC REFERENCES" list in the back of Volure II.

13. Reviews. This section supplies additional information to enable the reader to make knowledgeable evaluations of potential chemical hazards. There are three types of reviews listed: (a) general toxicology review articles; (b) International Agency for Research on Cancer (IARC) monograph reviews, which are published by the United Nations World Health Organization (WHO); and (c) Threshold Limit Values, which are recommended limits proposed by the American Conference of Governmental Industrial Hygienists (ACGIH).

BEST COPY AVAILABLE

a. Cancer Reviews. In the U.N. International Agency for Research on Cancer (IARC) monographs, information on suspected environmental carcinogens is examined, and summaries of available data with appropriate references are presented. Included in these reviews are synonyms, physical and chemical properties, uses and occurrence, and biological data relevant to the evaluation of carcinogenic risk to humans. The 32 monographs in the series contain an evaluation of approximately 750 substances. Single copies of the individual monographs (specify volume number) can be ordered from WHO Publications Centre USA, 49 Sheridan Avenue, Albany, New York 12210, telephone (518) 436-9686.

The format of the IARC data line is shown in Figure 1. The entry "CARCINOGENIC DETERMINATION" indicates that some carcinogenicity data pertaining to a compound has been reviewed by the IARC committee. The Registry summarizes the committee's conclusion in two words. The first indicates whether the data pertains to humans or to animals. The second word indicates the results of the determination as positive, suspected, indefinite, or negative. These four IARC classifications are described below.

(1) Positive - There is sufficient evidence that the substance is carcinogenic.

(2) Suspected - There is not sufficient evidence to substantially claim that the substance is carcinogenic, but limited data indicate that use of the substance is associated with cancer incidence.

(3) Indefinite - The available evidence is insufficient to substantiate the claim that use of the substance is related to subsequent development of cancer. Further testing would appear to be desirable. No evaluation of the substance's carcinogenicity can be made on the basis of the available data.

(4) Negative - No cancers are produced.

This cancer review reflects only the conclusion of the IARC committee based on the data available for the committee's evaluation. Hence, for some substances there may be disagreement between the IARC determination and the information in the tumorigenic data lines (see paragraph 10). Also, some substances previously reviewed by IARC may be reexamined as additional data become available. These substances will contain multiple IARC review lines, each of which is referenced to the applicable IARC monograph volume.

a. Threshold Limit Value (TLV). The TLV is an ACGIH-recommended concentration of a substance to which most workers can be exposed without adverse effect. The TLV's may be expressed as a time-weighted average (TWA), as a short term exposure limit (STEL), or as a ceiling value (CL). The TWA is for a normal 8-hour workday or 40-hour work week. The STEL is the maximum concentration to which workers can be exposed for up to 15 minutes, provided no more than four excursions per day are permitted with at least 60 minutes between exposure periods and provided the daily TWA is not also exceeded. The CL is the concentration that should not be exceeded even instantaneously. The notation "(skin)" indicates that even though the air concentration may be below the limit value, significant additional exposure to the skin may be dangerous. In addition, a separate TLV review line is included for those substances that ACGIH has classified as human carcinogens (either with or without an assigned TLV) or suspected carcinogens. The TLV's are taken from Documentation of the Threshold Limit Values for Chemical Substances in the Workroom Environment (fourth edition,1980, and subsequent annual revisions). Copies of the complete TLV Documentation may be ordered from ACGIH, 6500 Glenway Avenue, Building D-5, Cincinnati, Ohio 45211, telephone (513) 661-7881. The reader is cautioned that the TLV's are revised periodically. A "Notice of Intended Changes" for substances for which either a TLV is proposed for the first time or for which a change to an existing TLV is proposed is published annually by ACGIH. Proposed changes are considered trial limits for two years, after which they are considered for inclusion as an adopted TLV. Only substances for which TLV's have been adopted and final Documentation prepared are cited in RTECS. In addition, some TLV's are recommended for classes of substances rather than for individual compounds. These classes may be based on certain chemical or physical properties, such as solubility, that have not been determined for all potential members of the class. This makes it difficult to cite individual substances belonging to the class. Any questions about TLV citations in the Registry should be directed to ACGIH at the above address. Any errors should be brought to the attention of the editors at the address given in the Introduction.

b. Toxicology Reviews. The entry "TOXICOLOGY REVIEW" indicates that the cited review article has been located in the literature. Each review is identified by its CODEN. These articles discuss one or more facets of the toxicology of the substance or the general class to which the substance belongs. Most of these references do not contain specific dose values that can be cited in the Registry as irritation, mutation, reproductive, tumorigenic, or toxicity data (see 7, 8, 9, 10, and 11, respectively) because of the RTECS selection criteria. However, the reviews do provide useful information about the toxicity of the substance or group of related substances. The reader is cautioned that the scope of discussion varies greatly among the reviews. Some articles may contain a complete, detailed description of the toxicity of a substance; others may address only a particular aspect of the toxicity (e.g., effect of a substance on fetal development, or body fluid and tissue levels of a substance found under conditions of poisoning); and others may only list the substance in a general discussion of the toxicity of a class of compounds.

14. Standards and Regulations. This section contains notations indicating that the substance is regulated by an agency of the United States Government. The heading of these lines is "STANDARDS AND REGULATIONS," followed either by "OSHA," "EPA," or "DOT." "OSHA" refers to standards promulgated under Section 6 of the Occupational Safety and Health Act of 1970. These have been codified in 29 CFR 1910.1000. "EPA" refers to Worker Protection Standards for Agricultural Pesticides promulgated by the Environmental Protection Agency under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). "DOT" refers to substances regulated for shipment by the Department of Transportation. All standards and regulations are listed with the appropriate Federal Register or Code of Federal Regulations (CFR) reference. Because of frequent changes to and

BEST COPY AVAILABLE

litigation of Federal regulations, it is recommended that the reader contact the applicable agency for information about the current standards for a perticular substance. Omission of a substance or regulatory notation from the Registry does not imply any relief from regulatory responsibility.

OSHA air contaminant standards are noted with the entry "air" following "OSHA STANDARD." "TWA" or "CL" refers to either time-weighted average or ceiling value, respectively. For some substances, TWA, CL, and Pk (peak) values are given in the standard. In those cases, all three are listed. Finally, some entries may be followed by the designation "(skin)." This designation indicates that the compound may be absorbed by the skin and, even though the air concentration may be below the standard, significant additional exposure through the skin may be possible. The reader is cautioned that some OSHA standards are for classes of, rather than individual, substances. These classes may be based on certain chemical or physical properties that have not been well defined for every member of the class. Any questions about specific OSHA standards should be directed to your local or regional OSHA office, which is listed in the white telephone pages under "U.S. Government, Department of Labor." Any errors should be brought to the attention of the editors at the address given in the Introduction.

The entry "(SCP)" following "OSHA" indicates that a draft technical standard has been developed for the substance under the joint NIOSH/OSHA Standards Completion Program. Upon promulgation by OSHA, this draft technical standard fulfills the requirements for a complete standard for the substance as required by Sections 6 and 8 of the Occupational Safety and Health Act (29 CFR 1910.1000). A draft technical standard includes requirements for apprising employees of all hazards to which they are exposed, acceptable personal protective equipment, engineering control procedures, air sampling and analytical procedures, medical surveillance, and recordkeeping. The letter entry following SCP, for example "(SCP-A)," refers to a specific set of draft standards for a group of compounds that were prepared concurrently. Acceptable methods for sampling and analysis have been developed by NIOSH for many of the substances covered by a draft technical standard. A list of those substances and instructions for obtaining the analytical methods appear in Appendix II.

The information following the DOT or IMO notation for a substance has been obtained from the Department of Transportation. This notation indicates (a) the hazard class, (b) the label(s) required, and (c) the proper shipping name(s), as specified for transportation. Except for certain export and import shipments, no person may offer or accept a hazardous material, as defined by the Code of Federal Regulations, Title 49, for transportation in commerce within the United States unless that material is properly classed, described, packaged, marked, labeled, and in the condition for shipment as specified by 49 CFR, Parts 100 to 189. For transportation purposes, a hazardous material means a substance or material which has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce and which has been so designated.

Specific definitions are given for each hazard class addressed in 49 CFR; however, DOT reserves the right to regulate or deregulate materials whether or not they meet these definitions. The basic hazard classes include compressed gases, flammables, oxidizers, corrosives, explosives, radioactive materials, and poisons. Although a material may be designated by only one hazard class, additional hazards may be indicated by adding labels or by using other means directed by DOT.

It is essential, therefore, to know the hazard class of a substance and to use the proper label. Generally, a material meeting the DOT definition of a poison must always be labeled as a poison, regardless of the other labeling requirements to ensure adherence to the prohibition against shipping poisons with foodstuffs.

Specific shipping names are designated for hazardous materials listed in 49 CFR. Because of the presence of many nontechnical names or the use of archaic names for some materials, it is necessary to identify the DOT shipping names. The approved DOT shipping names are included as synonyms of the prime names and are identified by the addition of "(DOT)" to the name.

Substances not specifically identified in 49 CFR and not appearing in the Registry are not necessarily exempt from DOT regulations. The Registry contains only those substances specifically identified in 49 CFR. Generic names or general descriptive names such as "insecticide, liquid" are not included in the Registry. Determination of the correct classification for transportation of materials not specifically identified in 49 CFR is the responsibility of the shipper.

15. Criteria Documents. This entry indicates that a NIOSH criteria document recommending a certain environmental (occupational) exposure has been published for this compound or for a class of compounds to which this substance belongs. Included are the title of the document and the recommended standard. The CODEN citation "NTIS**" refers to the National Technical Information Service, U.S. Department of Commerce, from whom copies of the documents can be obtained. See Appendix I for a description of the NIOSH criteria document program, a list of completed criteria documents, and instructions for ordering them.

16. Status. This section provides information on the activities of various governmental agencies regarding the substance. Status lines are currently listed for NTP, NIOSH, EPA, and OSHA.

a. There are two types of NTP status lines listed in the RTECS file. The first indicates that the substance has been or is being tested by the National Toxicology Program (NTP) under its Carcinogenesis Testing Program. These entries were identified as National Cancer Institute (NCI) status lines in issues of the Registry prior to July 1980. However, the NCI Carcinogenesis Testing Program has been absorbed by NTP, and the status lines have been reformatted accordingly. The following different citations are used to reflect the current test status of the compound: nominated for test; selected for test; currently undergoing test; or test completed. These citations are updated as each bioassay progresses. Note that selection of a chemical for bioassay does not necessarily imply that it is a

BEST COPY AVAILABLE

carcinogen, and that a compound originally selected and even scheduled for bioassay may be withdrawn from the program anytime during testing or before testing actually begins. This initial selection is cited in the Registry but is deleted when the compound is removed from the test. It is therefore important that the reader monitor these status lines for changes The bioassay itself normally takes about two and one half years to conduct, and another year is required to prepare the final report. When this report is released, the report number and test results are listed, and, where applicable, specific tumorigenic dose lines (see paragraph 10) are generated. Final reports for some bioassays may not be published because the data are insufficient, and this is noted in the Registry where applicable. Also, some substances may be selected by NTP for retest after the first bioassay is completed and the final report issued. These duplicate studies are noted on a separate NTP status line. The reader should also note that some of the early NCI testing was not done in accordance with the strict experimental protocols now used. The results of these studies were not published as NCI bioassay reports, but instead appeared in the literature as journal articles. These are noted on the NTP status lines as "studies" rather than "bioassays," and references to the journals are given. To obtain additional information about the Carcinogenesis Testing Program or the status of a particular substance under test, or to obtain copies of the final bioassay reports, contact the Toxicology Information and Scientific Evaluation Group, NTP/TRTP/NIEHS, Mail Drop 18-01, P.O. Box 12233, Research Triangle Park, North Carolina 27709, Telephone (919)-541-3418.

The second type of NTP status line indicates that the substance is listed in the NTP "Fourth Annual Report on Carcinogens" (1984). This cumulative list is published in accordance with Public Law 95-622, which requires that the Secretary of the Department of Health and Human Services publish an annual report containing "... a list of all substances (i) which either are known to be carcinogens or which may reasonably be anticipated to be carcinogens and (ii) to which a significant number of persons residing in the United States are exposed ...." Included for each of the 194 chemicals in the report is a description of the substance, including a brief synopsis of the scientific evidence that led to its inclusion in the report. This is immediately followed by information about the regulatory activities of the NTP-participating Federal Agencies. For additional information about the report, contact the Public Information Office, National Toxicology Program, P.O. Box 12233, Research Triangle Park, North Carolina 27709, telephone (919) 541-3971. Subsequest NTP Reports on Carcinogens will be cited in future issues of the Registry.

b. NIOSH status lines are included for those substances for which an analytical method(s) has been developed by NIOSH or for substances for which NIOSH current intelligence bulletins (CIB's) have been issued. The former type of line includes a citation to the appropriate method number(s) in the "NIOSH Manual of Analytical Methods, Third Edition," which is identified by the CODEN citation "NIMAM*". The sampling and measurement methods in the Third Edition are revisions and additions to those contained in the Second Edition. A complete list of substances for which NIOSH analytical methods exist, along with instructions for ordering the Manual from the U.S. Government Printing Office, appear in Appendix II.

c. EPA status entries are included for three portions of the Toxic Substances Control Act (TSCA), Public Law 94-469: the Section 8(b) chemical inventory, Section 8(a) preliminary assessment information, and Section 8(e) substantial risk information. A TSCA inventory citation indicates that the substance appears on the chemical inventory prepared in 1980 by the Environmental Protection Agency in accordance with provisions of Section 8(b) of TSCA. Substances reported in the inventory include those that are produced commercially in or imported into this country. The reader should note, however, that substances already regulated by EPA under FIFRA and by the Food and Drug Administration under the Food, Drug, and Cosmetic Act, as amended, are not included in the TSCA inventory. Similarly, alcohol, tobacco, and explosive substances are not regulated under TSCA. TSCA regulations should be consulted for an exact definition of reporting requirements.

GENE-TOX: A Genetic Toxicology program status line indicates that the substance has been reported in the literature for potential genetic effects during 1969-1979. The test protocol in the literature is evaluated by an EPA Expert Panel on Mutations and a positive or negative effect of the substance is designated. To obtain additional information about this program, contact GENE-TOX Program, EPA, 401 M Street, TS796, Washington, D.C., 20460.

A preliminary assessment information status line indicates that EPA has promulgated both a final and a proposed rule under Section 8(a) of TSCA, reporting and retention of information. The final rule requires chemical manufacturers and, in some cases, processors and importers to report production and exposure-related data on approximately 250 chemicals to EPA. Included in this status line is a citation to the Federal Register issue (volume 47, page 26992, June 22, 1982) in which the rule appeared. This reference should be consulted for a complete explanation of the rule. The proposed rule (Federal Register, volume 47, page 27009, June 22, 1982) covers an additional 350 chemicals for which similar reporting would be required.

A substantial risk status line indicates that EPA has received and reviewed information submitted under Section 8(e) of TSCA, which requires that persons who obtain information which reasonably supports the conclusion that a substance presents substantial risk of injury to human health or the environment must notify EPA within 15 days. These notices are reviewed by EPA and an initial evaluation is prepared containing, if appropriate, follow-up questions to the submitter, referrals to other agencies, and decisions to list the chemical for a Section 8 reporting rule or to undertake a formal risk assessment. The submissions and the initial evaluations are in the Public Reading Room, 447 East Tower, Waterside Mall, 401 M Street, S.W., Washington, D.C. 20460. Persons wishing to request a copy of these notices may write to the EPA Freedom of Information Office (A-101), Washington, D.C. 20460. A duplication fee will be charged. The reader should note that many 8(e) notices represent a company's first review of a situation or datum and a judgment in compliance with the statute to submit a notice within 15 days of obtaining the information. EPA publishes its evaluations of these notices in order to make widely available this Section 8(e) information in a form understandable to the general public.

d. An OSHA medical records status line indicates that the substance meets one of the three criteria for being classified as a "toxic substance" for purposes of OSHA's proposed modification of the Access to Employee Exposure and Medical Records Rule, 29 CFR 1910.20. A complete description of the proposed changes appears in the Federal Register, volume 47, page 30420, July 13, 1982. For the reader's convenience, the applicable portion of the proposal is provided below.

"Toxic substance" means any chemical substance or biological agent (bacteria, virus, fungus, etc.) which:

(1) has yielded positive evidence of an acute or chronic health hazard (consistent with (3)(a)-(e) below) in testing conducted by, or known to, the employer;

(2) is the subject of a material safety data sheet kept by or known to the employer indicating that the material may pose a hazard to human health; or

(3) is listed in the latest printed edition of the NIOSH Registry of Toxic Effects of Chemical Substances (RTECS), provided that the substance:

(a) has been reported to cause human toxicity at any dose level;

(b) has been reported to cause cancer or reproductive effects in animals at any dose level;

(c) has a median lethal dose (LD50) of less than 500 milligrams per kilogram of body weight when administered orally to rats;

(d) has a median lethal dose (LD50) of less than 1000 milligrams per kilogram of body weight when administered by continuous contact to the bare skin of albino rabbits; or

(e) has a median lethal concentration (LC50) in air of less than 2000 parts per million by volume of gas or vapor, or less than 20 milligrams per liter of mist, fume, or dust when administered to albino rats.

As new data are added and corrections made to the RTECS file, the number of substances that meet the above criteria may change. Alternatively, OSHA may revise the criteria in (3) above, which will have a similar effect of changing the substances proposed for regulation. Therefore, the reader is cautioned to monitor these status lines for possible changes. For additional information about OSHA's proposed changes to the Access to Employee Exposure and Medical Records Rule, contact the Office of Special Standards Programs, OSHA, 200 Constitution Avenue, N.W., Room N-3663, Washington, D.C. 20210, telephone (202) 523-7166.

TABLE I

ROUTES OF ADMINISTRATION TO, OR EXPOSURE OF,
ANIMAL SPECIES TO TOXIC SUBSTANCES

Abbreviation	Route	Definition
eye	Eyes	Administration directly onto the surface of the eye. Used exclusively for primary irritation data. See Ocular
ial	Intraaural	Administration into the ear
iat	Intraarterial	Administration into the artery
ice	Intracerebral	Administration into the cerebrum
icv	Intracervical	Administration into the cervix
idr	Intradermal	Administration within the dermis by hypodermic needle
idu	Intraduodenal	Administration into the duodenum
ihl	Inhalation	Inhalation in chamber, by cannulation, or through mask
imp	Implant	Placed surgically within the body--location dsescribed in reference
ims	Intramuscular	Administration into the muscle by hypodermic needle
ipc	Intraplacental	Administration into the placenta
ipl	Intrapleural	Administration into the pleural cavity by hypodermic needle
ipr	Intraperitoneal	Administration into the peritoneal cavity
irn	Intrarenal	Administration into the kidney
isp	Intraspinal	Administration into the spinal canal
itr	Intratracheal	Administration into the trachea
itt	Intratesticular	Administration into the testes
iut	Intrauterine	Administration into the uterus
ivg	Intravaginal	Administration into the vagina
ivn	Intravenous	Administration directly into the vein by hypodermic needle
mul	Multiple	Administration into a single animal by more than one route
ocu	Ocular	Administration directly onto the surface of the eye or into the conjunctival sac; used exclusively for systemic toxicity data; see Eyes.
orl	Oral	Per os, intragastric, feeding, or introduction with drinking water
par	Parenteral	Administration into the body through the skin. Reference cited is not specific concerning the route used; could be ipr, scu, ivn, ipl, ims, irn, or ice
rec	Rectal	Administration into the rectum or colon in the form of enema or suppository
scu	Subcutaneous	Administration under the skin
skn	Skin	Application directly onto the skin, either intact or abraded. Used for both systemic toxicity and primary irritant effects
unk	Unreported	Dose, but not route, is specified in the reference

TABLE III

TOXIC EFFECTS CODE (TEC)

The Toxic Effect Code (TEC) is a three-character alphanumeric code used to describe in detail the specific effects described in the literature cited in the Registry. For a complete explanation of the TEC, see paragraph 11a of the Detailed File Description.

Position 1 - Organ, Tissue or Functional System

A Brain and coverings
B Spinal Cord
C Peripheral nerves and sensation
D Sense organs and special senses (nose, eye, ear and taste)
E Autonomic Nervous System
F Behavioral
G Cardiac
H Vascular
J Lung, thorax, respiration
K Gastrointestinal
L Liver
M Kidney, ureter, bladder
N Endocrine
P Blood
Q Musculo-skeletal
R Skin and appendages
S Immunological including allergic
U Nutritional and gross metabolic
V Tumorigenic
Y Biochemical
Z Reserved

Position 2 and 3 - Damage codes, two digits

Each of the major headings below correspond to one of the organs, tissues or functional systems listed in Position 1

A BRAIN AND COVERINGS

01 Meningeal changes
02 Changes in cerebral spinal fluid
03 Increased intracranial pressure
04 Changes in circulation (hemorrhage, thrombosis, etc)
05 Encephalitis
06 Demyelination
10 Changes in surface EEG
11 Recordings from specific areas of CNS
30 Other degenerative changes
60 Tumors

B SPINAL CORD

01 Meningeal changes
02 Changes in circulation
03 Inflammatory changes
04 Demyelination
30 Other degenerative changes
60 Tumors

C PERIPHERAL NERVE AND SENSATION

01 Associated connective tissue
02 Sensory syndrome diagnostic of central lesion
03 Sensory change involving trigeminal nerve
04 Sensory change involving peripheral nerve
05 Sensory change involving segmental distribution

BEST COPY AVAILABLE

06 Spastic paralysis with or without sensory change
07 Flaccid paralysis with appropriate anesthesia
08 Flaccid paralysis without anesthesia (usually neuromuscular blockade)
09 Fasciculations
10 Paresthesia
15 Recording from afferent nerve
16 Recording from peripheral motor nerve
17 Local anesthetic
18 Structural change in nerve or sheath

D SENSE ORGANS AND SPECIAL SENSES (NOSE, EYE, EAR AND TASTE)

Olfaction:

01 Deviated nasal septum
02 Ulcerated nasal septum
03 Change in olfactory nerve
04 Change in sensation of smell
07 Other
09 Tumors

Eye:

10 Optic nerve neuropathy
11 Cycloplegia
12 Changes in refraction
13 Ciliary spasm
14 Visual field changes
15 Miosis (Pupillary constriction)
16 Mydriasis (Pupillary dilation)
17 Lacrimation
18 Chromodacryorrhea
19 Increased intraocular pressure
20 Retinal changes (pigmentary deposition, retinitis, other)
21 Hemorrhage
22 Changes in circulation
23 Diplopia
24 Change in extra-ocular muscles
25 Conjunctiva irritation
26 Corneal damage
27 Iritis
28 Ptosis
29 Tumors
35 Other

Ear:

40 Change in acuity
41 Tinnitus
43 Changes in vestibular functions
44 Change in cochlear structure or function
45 Tumors

Taste:

50 Change in function

E AUTONOMIC NERVOUS SYSTEM

01 Sympathomimetic
02 Alpha adrenergic blocker
03 Beta adrenergic blocker
04 Central sympatholytic
05 Ganglion blocker
06 Ganglion facilitant
08 Other (direct) parasympathomimetic
09 Intensify beta adrenergic effects
15 Smooth muscle relaxant (mechanism undefined, spasmolytic)
16 Parasympatholytic

F BEHAVIORAL

01 General anesthetic
02 Anticonvulsant
03 Wakefulness
04 Sleep
05 Altered sleep time (including change in righting reflex)
06 Euphoria
07 Somnolence (general depressed activity)
08 Hallucinations, distorted perceptions
09 Changes in REM sleep (human)
10 Toxic Psychosis
11 Tremor
12 Convulsions or effect on seizure threshold
13 Excitement
14 Anorexia, human
15 Food intake (animal)
16 Fluid intake
17 Change in motor activity (specific assay)
18 Muscle weakness
19 Ataxia
20 Stiffness
21 Rigidity (includes catalepsy)
22 Tetany
23 Muscle contraction or spasticity
24 Coma
25 Antipsychotic
26 Antianxiety
27 Headache
29 Analgesia
30 Tolerance
31 Withdrawal
32 Abuse
33 Irritability
40 Alteration of classical conditioning
41 Alteration of operant conditioning
42 Change in psychophysiological tests
43 Aggression

G CARDIAC

01 Cardiomyopathy including infarction
02 Changes in coronary arteries
03 Pericarditis
04 Arrythmias (including changes in conduction)
05 Cardiomegaly
06 EKG changes not diagnostic of above
07 Pulse rate increased without fall in BP
08 Pulse rate decreased with fall in BP
09 Change in force of contraction
10 Change in rate
11 Change in conduction velocity
12 Cardiac output
13 Change in resting or action potential
30 Other changes
60 Tumors

H VASCULAR

01 BP elevation not characterized in autonomic section
02 BP lowering not characterized in autonomic section
03 Pulse pressure increase
04 Regional or general arteriolar constriction
05 Regional or general arteriolar or venous dilation
06 Measurement of regional blood flow
07 Change in plasma or blood volume
08 Shock
15 Acute arterial occulsion

BEST COPY AVAILABLE

16 Structural changes in vessels
17 Thromobosis distant from injection site (except brain, heart)
20 Contraction (isolated tissues)
21 Relaxation (isolated tissues)
30 Other changes
35 Effect on gills and gill functions
60 Tumors

J LUNGS, THORAX OR RESPIRATION

01 Ciliary function changes
02 Structural or functional change in trachea or bronchi
03 Bronchiolar dilation
04 Bronchiolar constriction, incl asthma
05 Bronchiectasis
06 Emphysema
07 Changes in pulmonary vascular resistance
08 Consolidation
12 Fibrosis, focal (pneumoconiosis)
13 Fibrosis, interstitial
14 Fibrosing alveolitis
15 Acute pulmonary edema
16 Chronic pulmonary edema or congestion
17 Pleural effusion
18 Pleural thickening
20 Respiratory obstruction
21 Cough
22 Dyspnea
23 Sputum
24 Cyanosis
25 Respiratory depression
26 Respiratory stimulation
27 Pulmonary emboli
30 Other changes
60 Tumors
61 Bronchogenic carcinoma

K GASTROINTESTINAL

01 Changes in structure or function of salivary glands
02 Changes in structure or function of exocrine pancreas
03 Changes in structure or function of esophagus
04 Alteration in gastric secretion
05 Gastritis
06 Ulceration or bleeding from stomach
07 Ulceration or bleeding from duodeum
08 Ulceration or bleeding from small intestine
09 Ulceration or bleeding from large intestine
12 Hypermotility, diarrhea
13 Nausea or vomiting
14 Decreased motility or constipation
15 Malabsorption
17 Peritonitis
20 Necrotic changes
30 Other changes
31 Contraction (isolated tissue)
32 Relaxation (isolated tissue)
60 Tumors
61 Colon tumors

Teeth (See musculoskeletal)

L LIVER

01 Hepatitis (hepatocellular necrosis), diffuse
02 Hepatitis (hepatocellular necrosis), zonal
03 Fatty liver degeneration
04 Hepatitis, fibrous (cirrhosis, post-necrotic scarring)
10 Jaundice (or hyperbilirubinemia) hepatocellular

BEST COPY AVAILABLE

11 Jaundice, cholestatic
12 Jaundice, other or unclassified
14 Liver function tests impaired
15 Change in gall bladder structure or function
30 Other changes
50 Multiple effects
60 Tumors
61 Angiosarcoma

M KIDNEY, URETER, BLADDER

01 Changes in blood vessels or in circulation of kidney
02 Changes primarily in glomeruli
03 Changes in tubules (including acute renal failure, acute tubular necrosis)
04 Changes in both tubules and glomeruli
05 Interstitial nephritis
10 Urine volume increased
11 Urine volume decreased or anuria
12 Renal function tests depressed
13 Proteinuria
14 Hematuria
16 Other changes in urine composition
20 Inflammation, necrosis or scarring of bladder
21 Structural or functional change in ureter
30 Other changes
60 Bladder tumors
61 Kidney tumors

N ENDOCRINE

01 Antidiuresis
02 Change in LH
03 Change in GH
04 Change in gonadotropins
05 Thyroid weight (goiter)
06 Toxic goiter-hypofunction
07 Evidence of thyroid hyperfunction
08 Evidence of thyroid hypofunction
10 Hyperparathyroidism
12 Adrenal cortex hyperplasia
13 Adrenal cortex hypoplasia
15 Aldosteronism
16 Androgenic
17 Estrogenic
18 Differential effect of sex or castration on observed toxicity
19 Effect on menstrual cycle
20 Gynecomastia
21 Diabetes mellitus
22 Hypoglycemia
23 Ketosis
24 Hyperglycemia
25 Diabetes insipidus (nephrogenic or CNS)
30 Other changes
60 Tumors
61 Adrenal cortex tumors
62 Thyroid tumors

P BLOOD

01 Hemorrhage
02 Change in clotting factors
05 Normocytic anemia
06 Microcytosis with or without anemia
07 Macrocytosis
08 Pigmented or nucleated RBC
13 Granulocytopenia
14 Luekopenia
15 Angranulocytosis

BEST COPY AVAILABLE

16 Eosinophilia
17 Thrombocytopenia
20 Changes in cell count (unspecified)
22 Oxidant related (GPD deficient) anemia
23 Other hemolysis with or without anemia
24 Methemoglobinemia-Carboxhemoglobinemia
25 Aplastic anemia
26 Changes in bone marrow not included in abovr
27 Changes in spleen
30 Other changes
60 Tumors
61 Leukemia
62 lymphoma including Hodgkin's disease

Q MUSCULO-SKELETAL

See also Behavioral for muscle changes secondary to CNS or metabolic changes

01 Changes in teeth and supporting structures
05 Osteoporosis
10 Osteomalacia
15 Joints
30 Other changes
60 Tumors

R SKIN AND APPENDAGES

Skin:

After systemic exposure
01 Dermatitis, allergic
02 Dermatitis, irritative
03 Dermatitis, other
04 Photosensitivity

After topical application
10 Primary irritation
11 Corrosive
12 Dermatitis, allergic
13 Cutaneous sensitization (experimental)
14 Photosensitivity

Other:

20 Sweating
21 Hair
22 Nails
25 Breast
30 Other glands (animal)
60 Tumors

S IMMUNOLOGICAL INCLUDING ALLERGIC

01 Increase in cellular immune response
02 Decrease in cellular immune response
03 Increase in humoral response
04 Decrease in humoral immune response
05 Decreased immune response
06 Increased immune response

Allergic (Multiple organ involvement)

When single organs are involved code under organ
Cholestatic jaundice - see liver
Aplastic anemia, agranulocytosis - see blood
Allergic dermatitis - see skin

BEST COPY AVAILABLE

15 Anaphylaxis
16 Other immediate (humoral): urticaria, allergic rhinitis, serum sickness
18 Hypersensitivity delayed
20 Autoimmune
25 Uncharacterized

U NUTRITIONAL AND GROSS METABOLIC

See also Biochemical Effects (Intermediary Metabolism)

01 Weight loss or decreased weight gain
02 Conditioned vitamin deficiency
03 Dehydration

Changes in:

05 Na
06 Cl
07 Ca
08 P
09 Fe
10 K
11 Other metals
20 Metabolic acidosis
21 Metabolic alkalosis
25 Body temperature increase
26 Body temperature decrease
30 Other changes

V TUMORIGENIC

Tumorigenic effects in humans and animals - See organ system

01 Carcinogenic by RTECS criteria
02 Neoplastic by RTECS criteria
03 Equivocal Tumorigenic Agent by RTECS criteria
05 Cells (cultured) transformed
08 Increased incidence of tumors in susceptible strain
10 Tumors at site of application
15 Tumor types after systemic administration not seen spontaneously
16 Facilitates action of known carcinogens
25 Protects against induction of experimental tumors
30 Active as anti-cancer agent

7909 Y BIOCHEMICAL EFFECTS

Enzyme inhibition, induction or change in blood or tissue levels

01 True cholinesterase
02 Other esterases
03 Phosphatases
04 Other hydrolases
05 Cabonic anhydrase
06 Xanthine oxidases
07 Hepatic microsomal mixed oxidase (dealkylation, hydroxylation, etc)
08 Monoamine oxidase
09 Cytochrome oxidases (includes oxidative phosphorylation)
10 Dehydrogenases
11 Catalases
12 Other oxidoreductases
13 Phosphokinase
14 Hexokinases
15 Transaminases
16 Other transferases

BEST COPY AVAILABLE

17 Peptidases
18 Proteases
19 Isomerases
20 Multiple enzyme effects
21 Other enzymes
23 Reactivates cholinesterase

Effect on specific coenzyme

25 B vitamin including Folate
26 CoA
27 NAD, NADP
28 Others
29 Proportion of isoenzymes
30 Disturbed regulation

Metabolism (Intermediary)

35 Xanthine, purine or nucleotides including urate
36 Porphyrin including bile pigments
37 Lipids including transport
38 Amino acids (including renal excretion)
39 Plasma proteins not involving coagulation
40 Other proteins
41 Glycolytic
42 TCS cycle
43 Pentase shunt
44 Other carbohydrates
45 Histamines (including liberation not immunochemical in origin)
50 Effect on mitochondrial function
51 Effect on active transport
52 Effect on Na-K pump
53 Other
54 Effect on cyclic nucleotides
55 Effect on inflammation or mediation of inflammation

Neurotransmitters or modulators (putative)

60 Catecholamine levels in sympathetic nerves
61 Catecholamine levels in CNS
64 Dopamine in striatum
65 Dopamine at other sites

Z Reserved

BEST COPY AVAILABLE

TABLE IV

REPRODUCTIVE EFFECTS CODE

The Reproductive Effects Code is a subset "T" of the more general Toxic Effects Code (TEC) and is formatted in the same manner as the TEC (See Table III

Paternal Effects:

T01 Spermatogenesis (including genetic material, sperm morphology, motility, and count)
T02 Testes, epididymis, sperm duct
T03 Prostate, seminal vesicle, Cowper's gland, accessory glands
T04 Impotence
T05 Breast development
T09 Other effects on male

Maternal Effects:

T11 Oogenesis
T12 Ovaries, fallopian tubes
T13 Uterus, cervix, vagina
T14 Menstrual cycle changes or disorders
T15 Breasts, lactation (prior to or during pregnancy)
T16 Parturition
T17 Postpartum
T19 Other effects on female

Effects on Fertility:

T21 Mating performance (e.g., # sperm positive females per # females mated; # copulations per # estrus cycles)
T22 Female fertility index (e.g., # females pregnant per # sperm positive females; # females pregnant per # females mated)
T23 Male fertility index (e.g., # males impregnating females per # males exposed to fertile nonpregnant females)
T24 Pre-implantation mortality (e.g., reduction in number of implants per female; total number of implants per corpora lutea)
T25 Post-implantation mortality (e.g., dead and/or resorbed implants per total number of implants)
T26 Litter size (e.g., # fetuses per litter; measured before birth)
T27 Abortion
T29 Other measures of fertility

Effects on Embryo or Fetus:

T31 Extra embryonic structures (e.g., placenta, umbilical cord)
T32 Maternal-fetal exchange
T33 Cytological changes (including somatic cell genetic material)
T34 Fetotoxicity (except death, e.g., stunted fetus)
T35 Fetal death
T39 Other effects to embryo or fetus

Specific Developmental Abnormalities:

T41 Central nervous system
T42 Eye, ear
T43 Craniofacial (including nose and tongue)
T44 Skin and skin appendages
T45 Body wall
T46 Musculoskeletal system
T47 Cardiovascular (circulatory) system
T48 Blood and lymphatic systems (including spleen and marrow)
T49 Respiratory system
T50 Gastrointestinal system
T51 Hepatobiliary system
T52 Endocrine system

BEST COPY AVAILABLE

T53 Urogenital system
T54 Immune and reticuloendothelial system
T55 Homeostasis
T59 Other developmental abnormalities

Tumorigenic Effects:

T61 Testicular tumors
T62 Prostate tumors
T63 Ovarian tumors
T64 Uterine tumors
T65 Transplacental tumorigenesis
T69 Other reproductive system tumors

Effects on Newborn:

T71 Stillbirth
T72 Live birth index (similar to T26, except measured after birth)
T73 Sex ratio
T74 Apgar score (humans only)
T75 Viability index (e.g., # alive at day 4 per # born alive)
T76 Weaning or lactation index (e.g., # alive at weaning per # alive at day 4)
T77 Other neonatal measures or effects
T81 Growth statistics (e.g., reduced weight gain)
T82 Germ cell effects (in offspring)
T83 Biochemical and metabolic
T84 Drug dependence
T85 Behavioral
T86 Physical
T87 Other postnatal measures or effects
T91 Delayed effects

TOXICOLOGY REVIEW: 32XPAD 49,75; ARVPAX 5,447.65

STATUS:

★ EPA GENETIC TOXICOLOGY PROGRAM, JANUARY 1984

MEETS CRITERIA FOR PROPOSED OSHA MEDICAL RECORDS RULE

AR7875000 ACRIDINE, 6-CHLORO-9-((4-(DIETHYLAMINO)-1-METHYLBUTYL)AMINO)-2-METHOXY-, DIHYDROCHLORIDE

UPDT:8411 CAS: 69-05-6 MW: 472.93 MOLFM: C23-H30-Cl-N3-O, 2Cl-H

SYN: ACRICHINE * ACRIQUINE * ARICHIN * ATABRINE * ATABRINE DIHYDROCHLORIDE * ATABRINE HYDROCHLORIDE * ATEBRIN * ATEBRINE * ATEBRIN HYDROCHLORIDE * CHEMOCHIN * CHINACRIN * CHINACRIN HYDROCHLORIDE * 2-CHLORO-5-(omega-DIETHYLAMINO, alpha-METHYLBUTYLAMINO)-7-METHOXYACRIDINE DIHYDROCHLORIDE * 3-CHLORO-9-(4-DIETHYLAMINO-1-METHYLBUTYLAMINO)-7-METHOXYACRIDINE DIHYDROCHLORIDE * 6-CHLORO-9-(4-DIETHYLAMINO-1-METHYLBUTYLAMINO)-2-METHOXYACRIDINE DIHYDROCHLORIDE * 3-CHLORO-7-METHOXY-9-(1-METHYL-4-DIETHYLAMINOBUTYLAMINO)ACRIDINE DIHYDROCHLORIDE * CRINODORA * DAC * ERION * ITALCHIN * MALARICIDA * QUYL * MEPACRINE DIHYDROCHLORIDE * MEPACRINE HYDROCHLORIDE * METHOQUINE * 2-METHOXY-6-CHLORO-9-(4-DIETHYLAMINO-1-METHYLBUTYLAMINO)ACRIDINE DIHYDROCHLORIDE * METOCHIN * METOQUIN * METOQUINE * PALACRIN * PALUDAN * PENTABEN * QUINACRINE DIHYDROCHLORIDE * QUINACRINE HYDROCHLORIDE * Sno-KP * SN 390 * S. N. 390
